## Foreword

## Chapter 1 Messages

1.1	ASCII .....	31
1.2	Abbreviated ASCII .....	33
1.3	Binary .....	33
1.4	Description of ASCII and Binary Logs with Short Headers .....	44
1.5	Message Responses .....	45
1.5.1	Abbreviated ASCII Response .....	45
1.5.2	ASCII Response .....	45
1.5.3	Binary Response .....	45
1.6	GLONASS Slot and Frequency Numbers .....	47
1.6.1	PRN Numbers .....	48
1.7	GPS Reference Time Status .....	48
1.8	Message Time Stamps .....	50
1.9	Decoding of the GPS Reference Week Number .....	50
1.10	32-Bit CRC .....	50

## Chapter 2 Commands

2.1	Command Formats .....	54
2.1.1	Optional Parameters .....	54
2.2	Command Settings .....	54
2.3	Command Defaults .....	55
2.4	ADJUST1PPS .....	56
2.5	ALIGNAUTOMATION .....	63
2.6	ANTENNAPOWER .....	65
2.7	ANTENNATYPE .....	67
2.8	APPROXPOSTIMEOUT .....	69
2.9	ASSIGN .....	70
2.10	ASSIGNALL .....	73
2.11	ASSIGNLBANDBEAM .....	75
2.12	AUTH .....	77
2.13	AUTOSURVEY .....	80
2.14	BASEANTENNAPCO .....	82
2.15	BASEANTENNAPCV .....	84
2.16	BASEANTENNATYPE .....	85

---

# Customer Support

## NovAtel Knowledge Base

If you have a technical issue, visit the NovAtel Support page at [novatel.com/support](http://novatel.com/support). Through the *Support* page, you can contact Customer Support, find papers and tutorials or download the latest firmware. To access the latest user documentation, visit [docs.novatel.com/OEM7](http://docs.novatel.com/OEM7).

## Before Contacting Customer Support

Before contacting NovAtel Customer Support about a software problem, perform the following steps:

If logging data over an RS-232 serial cable, ensure that the configured baud rate can support the data bandwidth (see **SERIALCONFIG** command). NovAtel recommends a minimum suggested baud rate of 230400 bps.

1. Log the data suggested in the appropriate *Troubleshooting Logs* section to a file on your computer for 15 minutes.
  - *General Troubleshooting Logs* on the next page
  - *Tracking and Interference Troubleshooting Logs* on the next page
  - *SPAN Troubleshooting Logs* on page 26
  - *RTK Troubleshooting Logs* on page 26
  - *PPP Troubleshooting Logs* on page 27
  - *ALIGN Troubleshooting Logs* on page 27
2. Send the data file to NovAtel Customer Support: [support.novatel@hexagon.com](mailto:support.novatel@hexagon.com)
3. You can also issue a **FRESET** command to the receiver to clear any unknown settings.

The **FRESET** command will erase all user settings. You should know your configuration (by requesting the RXCONFIGA log) and be able to reconfigure the receiver before you send the **FRESET** command.

If you are having a hardware problem, send a list of the troubleshooting steps taken and the results.

## Contact Information

Log a support request with NovAtel Customer Support using one of the following methods:

### Log a Case and Search Knowledge:

Website: [novatel.com/support](http://novatel.com/support)

### Log a Case, Search Knowledge and View Your Case History: (login access required)

Web Portal: <https://novatelsupport.force.com/community/login>

### E-mail:

[support.novatel@hexagon.com](mailto:support.novatel@hexagon.com)

**Telephone:**

U.S. and Canada: 1-800-NOVATEL (1-800-668-2835)

International: +1-403-295-4900

# Foreword

This manual describes each command and log the OEM7 receivers and are capable of accepting or generating. Sufficient detail is provided so you can understand the purpose, syntax and structure of each command or log. You will also be able to communicate with the receiver, enabling you to effectively use and write custom interfacing software for specific applications.

## Related Documents and Information

OEM7 products include the following:

- Support for all current and upcoming GNSS constellations
- Real-Time Kinematic (RTK)
- L-Band capability including TerraStar licensed based corrections
- Satellite Based Augmentation System (SBAS) signal functionality
- Differential Global Positioning System (DGPS)
- National Marine Electronics Association (NMEA) standards, a protocol used by GNSS receivers to transmit data

For more information on these components, refer the Support page on our website at [novatel.com/support](http://novatel.com/support). For introductory information on GNSS technology, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

This manual does not address any of the receiver hardware attributes or installation information. Consult the product specific Installation and Operation User Manuals for information about these topics ([docs.novatel.com/OEM7](http://docs.novatel.com/OEM7)). Furthermore, should you encounter any functional, operational or interfacing difficulties with the receiver, refer to the NovAtel web site for warranty and support information.

## Prerequisites

As this reference manual is focused on the OEM7 family commands and logging protocol, it is necessary to ensure the receiver has been properly installed and powered up according to the instructions outlined in the companion product specific user manuals ([docs.novatel.com/OEM7](http://docs.novatel.com/OEM7)).

## Commands and Logs Defaults and Structure

- The factory defaults for commands and logs are shown after the syntax but before the example in the command or log description.
- The letter H in the Binary Byte or Binary Offset columns of the commands and logs tables represents the header length for that command or log, see *Binary* on page 33.
- The number following 0x is a hexadecimal number.
- Default values shown in command tables indicate the assumed values when optional parameters have been omitted. Default values do not imply the factory default settings.
- Parameters surrounded by [ and ] are optional in a command or are required for only some instances of the command depending on the values of other parameters.
- Text displayed between < and > indicates the entry of a keystroke in the case of the command or an automatic entry in the case of carriage return <CR> and line feed <LF> in data output.
- In tables where no values are given they are assumed to be reserved for future use.

- Status words in ASCII logs are output as hexadecimal numbers and must be converted to binary format (and in some cases then also to decimal) to parse the fields because they are not fixed in 4-bits boundary. For an example of this type of conversion, see the RANGE log, *Table 149: Channel Tracking Status* on page 704.
- Conversions and their binary or decimal results are always read from right to left. For a complete list of hexadecimal, binary and decimal equivalents, refer to the [Unit Conversions](#) information available on our website at [novatel.com/support](http://novatel.com/support).
- ASCII log examples may be split over several lines for readability. In reality, only a single [CR][LF] pair is transmitted at the end of an ASCII log.

You can download the most up-to-date version of this manual from the OEM7 Documentation Portal ([docs.novatel.com/OEM7](https://docs.novatel.com/OEM7)).

# Chapter 1 Messages

The receiver handles incoming and outgoing NovAtel data in three different message formats: Abbreviated ASCII, ASCII and Binary. This allows for a great deal of versatility in the way the OEM7 receivers can be used. All NovAtel commands and logs can be entered, transmitted, output or received in any of the three formats. The receiver also supports RTCMV3, NOVATELX and NMEA format messaging.

When entering an ASCII or abbreviated ASCII command to request an output log, the message type is indicated by the character appended to the end of the message name. 'A' indicates the message is ASCII and 'B' indicates binary. No character means the message is Abbreviated ASCII. When issuing binary commands, the output message type is dependent on the bit format in the message's binary header (refer to *Binary* on page 33).

Table 1: *Field Type* below below, describes the field types used in the description of messages.

**Table 1: Field Type**

Type	Binary Size (bytes)	Description
Char	1	The <b>char</b> type is an 8-bit integer in the range -128 to +127. As a binary value, a two's compliment format is used. This integer value may be the ASCII code corresponding to the specified character. In ASCII or Abbreviated ASCII this comes out as an actual character.
UChar	1	The <b>uchar</b> type is an 8-bit unsigned integer. Values are in the range from +0 to +255. In ASCII or Abbreviated ASCII this comes out as a number.
Short	2	The <b>short</b> type is 16-bit integer in the range -32768 to +32767. As a binary value, a two's compliment format is used.
UShort	2	The same as short except it is not signed. Values are in the range from +0 to +65535.
Long	4	The <b>long</b> type is 32-bit integer in the range -2147483648 to +2147483647. As a binary value, a two's compliment format is used.
ULong	4	The same as long except it is not signed. Values are in the range from +0 to +4294967295.
Double	8	The <b>double</b> type contains 64-bits: 1 for sign, 11 for the exponent and 52 for the mantissa. Its range is $\pm 1.7E308$ with at least 15 digits of precision. This is IEEE 754.
Float	4	The <b>float</b> type contains 32-bits: 1 for the sign, 8 for the exponent and 23 for the mantissa. Its range is $\pm 3.4E38$ with at least 7 digits of precision. This is IEEE 754.
Enum	4	A 4-byte enumerated type beginning at zero (an unsigned long). In binary, the enumerated value is output. In ASCII or Abbreviated ASCII, the enumeration label is spelled out.
GPSec	4	This type has two separate formats dependent on whether you requested a binary or an ASCII format output. For binary, the output is in milliseconds and is a <b>long</b> type. For ASCII, the output is in seconds and is a <b>float</b> type.
Hex	n	<b>Hex</b> is a packed, fixed length (n) array of bytes in binary but in ASCII or Abbreviated ASCII is converted into 2 character hexadecimal pairs.
Hex Ulong	4	An unsigned, 32-bit integer in hexadecimal format. Values are in the range from +0 to +4294967295.

Type	Binary Size (bytes)	Description
String	n	<b>String</b> is a variable length array of bytes that is null-terminated in the binary case and additional bytes of padding are added to maintain 4-byte alignment. The maximum byte length for each String field is shown in the row in the log or command tables.

Figure 1: Byte Arrangements

*Byte Arrangements* above shows the arrangement of bytes, within each field type, when used by IBM PC computers. All data sent to or from the OEM7 receivers is ordered least significant bit (LSB) first (little-endian). This is opposite to the most significant bit first (big-endian) ordering that is shown in *Byte Arrangements* above. Data is then stored in the receiver LSB first. For example, in char type data, the LSB is bit 0 and the most significant bit (MSB) is bit 7. See *Table 149: Channel Tracking Status* on page 704 for a more detailed example.

## 1.1 ASCII

ASCII messages are readable by both the user and a computer. The structures of all ASCII messages follow the general conventions as noted here:

1. The lead code identifier for each record is '#'.
2. Each log or command is of variable length depending on amount of data and formats.
3. All data fields are delimited by a comma ',' with two exceptions:
  - The first exception is the last header field which is followed by a ';' to denote the start of the data message.
  - The second exception is the last data field, which is followed by a '\*' to indicate end of message data.

4. Each log ends with a hexadecimal number preceded by an asterisk and followed by a line termination using the carriage return and line feed characters.  
For example:  
\*1234ABCD[CR][LF]. This value is a 32-bit CRC of all bytes in the log, excluding the '#' identifier and the asterisk preceding the eight CRC digits.  
See *32-Bit CRC* on page 50 for the algorithm used to generate the CRC.
5. The receiver only accepts the following ASCII characters.
  - characters between space (ASCII value 32) and '~' (ASCII value 126) inclusive,
  - vertical tab (ASCII value 9)
  - line feed (ASCII value 10)
  - horizontal tab (ASCII value 11)
  - carriage return (ASCII value 13)

Other values are discarded and can lead to unexpected results.
6. An ASCII string is one field and is surrounded by double quotation marks.  
For example:  
"ASCII string". If separators are surrounded by quotation marks then the string is still one field and the separator will be ignored (example, "xxx,xxx" is one field). Double quotation marks within a string are not allowed.
7. If the receiver detects an error parsing an input message, it returns an error response message. See *Responses* on page 1053 for a list of response messages from the receiver.

**Message Structure:**

header;   data field...,   data field...,   data field...   \*xxxxxxxx   [CR][LF]

The ASCII message header structure is described in *Table 2: ASCII Message Header Structure* below.

**Table 2: ASCII Message Header Structure**

Field	Field Name	Field Type	Description	Ignored on Input
1	Sync	Char	Sync character. The ASCII message is always preceded by a single '#' symbol	N
2	Message	Char[]	The ASCII name of the log or command	N
3	Port	Char[]	The name of the port from which the log was generated. The string is made up of the port name followed by an _x where x is a number from 1 to 31 denoting the virtual address of the port. If no virtual address is indicated, it is assumed to be address 0	Y
4	Sequence #	Long	Used for multiple related logs. It is a number that counts down from N-1 to 0, where 0 means it is the last one of the set. Most logs only come out one at a time in which case this number is 0	N
5	% Idle Time	Float	The minimum percentage of time the processor is idle, calculated once per second	Y

Field	Field Name	Field Type	Description	Ignored on Input
6	Time Status	Enum	The value indicates the quality of the GPS reference time (see <i>Table 11: GPS Reference Time Status</i> on page 48)	Y
7	Week	Ulong	GPS reference week number	Y
8	Seconds	GPSTime	Seconds from the beginning of the GPS reference week; accurate to the millisecond level	Y
9	Receiver Status	Ulong	An eight digit hexadecimal number representing the status of various hardware and software components of the receiver (see <i>Table 182: Receiver Status</i> on page 781)	Y
10	Reserved	Ulong	Reserved for internal use	Y
11	Receiver S/W Version	Ulong	A value (0 - 65535) representing the receiver software build number	Y
12	;	Char	The character indicates the end of the header	N

**Example Log:**

```
#RAWEPHEMA, COM1, 0, 55.5, SATTIME, 2072, 133140.000, 02000000, 58ba, 15761; 32, 2072,
136800, 8b00602b57a606100004389101ee4e0eed24e012f216600007608cd27,
8b00602b58282f02373454d33b986d01bd01a76ba710a2a10d008e21667f,
8b00602b58ae003384abe701001226ff6c6c1c9999f3c99fffa77c2f05c8*d3806ea3
```

## 1.2 Abbreviated ASCII

This message format is designed to make entering and viewing commands and logs simple. The data is represented as simple ASCII characters, separated by spaces or commas and arranged in an easy to understand format. There is no 32-bit CRC for error detection because it is meant for viewing by the user.

**Example Command:**

```
log com1 loglist
```

**Resultant Log:**

```
<LOGLIST COM1 0 69.0 FINE 0 0.000 00240000 206d 0
< 4
< COM1 RXSTATUSEVENTA ONNEW 0.000000 0.000000 NOHOLD
< COM2 RXSTATUSEVENTA ONNEW 0.000000 0.000000 NOHOLD
< COM3 RXSTATUSEVENTA ONNEW 0.000000 0.000000 NOHOLD
< COM1 LOGLIST ONCE 0.000000 0.000000 NOHOLD
```

The array of 4 entries are offset from the left hand side and start with '<'.

## 1.3 Binary

Binary messages are strictly machine readable format. They are ideal for applications where the amount of data transmitted is fairly high. Due to the inherent compactness of binary as opposed to ASCII data, messages are

much smaller. The smaller message size allows a larger amount of data to be transmitted and received by the receiver's communication ports. The structure of all binary messages follows the general conventions as noted here:

1. Basic format of:
  - *Header*: 3 Sync bytes plus 25-bytes of header information. The header length is variable as fields may be appended in the future. Always check the header length.
  - *CRC*: 4 bytes
  - *Data*: variable
2. The 3 Sync bytes will always be:

Byte	Hex	Decimal
First	AA	170
Second	44	68
Third	12	18

3. The CRC is a 32-bit CRC (see *32-Bit CRC* on page 50 for the CRC algorithm) performed on all data including the header.
4. The header is in the format shown in *Table 3: Binary Message Header Structure* below.

**Table 3: Binary Message Header Structure**

Field	Field Name	Field Type	Description	Binary Bytes	Binary Offset	Ignored on Input
1	Sync	Uchar	Hexadecimal 0xAA	1	0	N
2	Sync	Uchar	Hexadecimal 0x44	1	1	N
3	Sync	Uchar	Hexadecimal 0x12	1	2	N
4	Header Length	Uchar	Length of the header	1	3	N
5	Message ID	Ushort	This is the Message ID number of the log (see the command or log descriptions for the Message ID values of individual commands or logs)	2	4	N

Field	Field Name	Field Type	Description	Binary Bytes	Binary Offset	Ignored on Input
6	Message Type	Char	Bits 0-4 = Measurement source <sup>1</sup> Bits 5-6 = Format 00 = Binary 01 = ASCII 10 = Abbreviated ASCII, NMEA 11 = Reserved Bit 7 = Response bit (see <i>Message Responses</i> on page 45) 0 = Original Message 1 = Response Message	1	6	N
7	Port Address	Uchar	See <i>Table 4: Detailed Port Identifier</i> on the next page (decimal values >=32 may be used) (lower 8-bits only) <sup>2</sup>	1	7	N <sup>3</sup>
8	Message Length	Ushort	The length in bytes of the body of the message, not including the header nor the CRC	2	8	N
9	Sequence	Ushort	Used for multiple related logs. It is a number that counts down from N-1 to 0 where N is the number of related logs and 0 means it is the last one of the set. Most logs only come out one at a time in which case this number is 0	2	10	N
10	Idle Time	Uchar	Time the processor is idle, calculated once per second. Take the time (0 – 200) and divide by two to give the percentage of time (0 – 100%). 0% indicates the processor is fully occupied. Other values indicate the availability of the processor to take on tasks.	1	12	Y
11	Time Status	Enum	Indicates the quality of the GPS reference time (see <i>Table 11: GPS Reference Time Status</i> on page 48).	1 <sup>4</sup>	13	N <sup>5</sup>
12	Week	Ushort	GPS reference week number	2	14	N

<sup>1</sup>Bits 0-4 are used to indicate the measurement source. For dual antenna receivers, if bit 0 is set, the log is from the secondary antenna.

<sup>2</sup>The 8-bit size means you will only see 0xA0 to 0xBF when the top bits are dropped from a port value greater than 8-bits. For example, ASCII port USB1 will be seen as 0xA0 in the binary output.

<sup>3</sup>Recommended value is THISPORT (decimal 192).

<sup>4</sup>This ENUM is not 4-bytes long but, as indicated in the table, is only 1-byte.

<sup>5</sup>Fields 12 and 13 (Week and ms) are ignored if Field 11 (Time Status) is invalid. In this case, the current receiver time is used. The recommended values for the three time fields are 0, 0, 0.

Field	Field Name	Field Type	Description	Binary Bytes	Binary Offset	Ignored on Input
13	ms	GPSTime	Milliseconds from the beginning of the GPS reference week	4	16	N
14	Receiver Status	Ulong	32-bits representing the status of various hardware and software components of the receiver (see <i>Table 182: Receiver Status</i> on page 781)	4	20	Y
15	Reserved	Ushort	Reserved for internal use	2	24	Y
16	Receiver S/W Version	Ushort	A value (0 - 65535) representing the receiver software build number	2	26	Y

COM1\_ALL, COM2\_ALL, COM3\_ALL, COM4\_ALL, COM5\_ALL, THISPORT\_ALL, FILE\_ALL, ALL\_PORTS, USB1\_ALL, USB2\_ALL, USB3\_ALL, AUX\_ALL, ETH1\_ALL, ICOM1\_ALL, ICOM2\_ALL, ICOM3\_ALL, ICOM4\_ALL, ICOM5\_ALL, ICOM6\_ALL, ICOM7\_ALL, CCOM1\_ALL, CCOM2\_ALL, CCOM3\_ALL, CCOM4\_ALL, CCOM5\_ALL, CCOM6\_ALL, NCOM1\_ALL, NCOM2\_ALL, NCOM3\_ALL, SCOM1\_ALL, SCOM2\_ALL, SCOM3\_ALL, SCOM4\_ALL and WCOM1\_ALL are only valid for the **UNLOGALL** command.

The ports available vary based on the receiver.

*Table 5: Available Port Types* on the next page provides examples of where each port type might be used.

**Table 5: Available Port Types**

Port Type	Description	Example of where it might be used
AUX	Auxiliary "serial" ports	An additional UART serial port available only on certain platforms
BTx	Bluetooth ports	These ports are used to connect over Bluetooth devices, when the receiver is equipped with a BT device
COMx	Serial Port	UART serial ports. Used when there is a physical RS-232 or RS-422 connection to the receiver
ICOMx	Internet ports	These ports are used when establishing TCP or UDP connections to the receiver over a network
NCOMx	NTRIP ports	These ports are used when establishing NTRIP connections to the receiver over a network
SCOMx	Script ports	Ports used by the Scripted User Interface (i.e. Lua)
USBx	USB "serial" ports	When the receiver is connected to an external host through USB, these ports are available
WCOMx	Web Server port	Ports used by Web Server applications, for receivers equipped with a web server

## 1.4 Description of ASCII and Binary Logs with Short Headers

One difference from the standard OEM7 logs is there are two possible headers for the ASCII and binary versions of the INS logs. Which header is used for a given log is described in the log definitions in the *SPAN Logs* on page 932 chapter. The reason for the alternate short headers is that the normal OEM7 binary header is quite long at 28 bytes. This is nearly as long as the data portion of many of the INS logs and creates excess storage and baud rate requirements.

These logs are set up in the same way as normal ASCII or binary logs except a normal ASCII or binary header is replaced with a short header (see *Table 6: Short ASCII Message Header Structure* below and *Table 7: Short Binary Message Header Structure* on the next page).

**Table 6: Short ASCII Message Header Structure**

Field	Field Name	Field Type	Description
1	%	Char	% symbol
2	Message	Char	This is the name of the log
3	Week Number	Ushort	GNSS week number
4	Seconds	GPSec	Seconds from the beginning of the GNSS week (Same byte arrangement as a Float type)

Table 7: Short Binary Message Header Structure

Field	Field Name	Field Type	Description	Binary Bytes	Binary Offset
1	Synch	Char	Hex 0xAA	1	0
2	Synch	Char	Hex 0x44	1	1
3	Synch	Char	Hex 0x13	1	2
4	Message Length	Uchar	Message length, not including header or CRC	1	3
5	Message ID	Ushort	Message ID number	2	4
6	Week Number	Ushort	GNSS week number	2	6
7	Milliseconds	GPsec	Milliseconds from the beginning of the GNSS week (Same byte arrangement as a Long type)	4	8

## 1.5 Message Responses

By default, if you input a message you get back a response. If desired, the **INTERFACEMODE** command (see page 189) can be used to disable response messages. The response will be in the exact format you entered the message (that is, binary input = binary response).

### 1.5.1 Abbreviated ASCII Response

The response is just the leading '<' followed by the response string, for example: <OK.

### 1.5.2 ASCII Response

The response is the full header with the message name being identical except ending in an 'R' (for response). The body of the message consists of a 40 character string for the response string. For example:

```
#BESTPOSR,COM1,0,67.0,FINE,1028,422060.400,02000000,a31b,0;"OK" *b867caad
```

### 1.5.3 Binary Response

The response is similar to an ASCII response except that it follows the binary protocols, see *Table 8: Binary Message Response Structure* on the next page.

*Table 9: Binary Message Sequence* on page 47 is an example of the sequence for requesting and then receiving BESTPOSB. The example is in hex format. When you enter a hex command, you may need to add a '\x' or '0x' before each hex pair, depending on your code. For example:

**0xAA0x440x120x1C0x010x000x02** and so on.

Table 8: Binary Message Response Structure

	Field	Field Name	Field Type	Description	Binary Bytes	Binary Offset
B I N A R Y  H E A D E R	1	Sync	Char	Hexadecimal 0xAA	1	0
	2	Sync	Char	Hexadecimal 0x44	1	1
	3	Sync	Char	Hexadecimal 0x12	1	2
	4	Header Length	Uchar	Length of the header	1	3
	5	Message ID	Ushort	Message ID number	2	4
	6	Message Type	Char	Response Bit 1 = Response Message	1	6
	7	Port Address	Uchar	See Table 4: Detailed Port Identifier on page 36	1	7
	8	Message Length	Ushort	The length in bytes of the body of the message (not including the CRC)	2	8
	9	Sequence	Ushort	Normally 0	2	10
	10	Idle Time	Uchar	Idle time	1	12
	11	Time Status	Enum	Table 11: GPS Reference Time Status on page 48	1 <sup>1</sup>	13
	12	Week	Ushort	GPS reference week number	2	14
	13	ms	GPSec	Milliseconds into GPS reference week	4	16
	14	Receiver Status	Ulong	Table 182: Receiver Status on page 781	4	20
	15	Reserved	Ushort	Reserved	2	24
	16	Receiver S/W Version	Ushort	Receiver software build number	2	26
I D	17	Response ID	Enum	The enumeration value corresponding to the message response (Table 251: Response Messages on page 1053)	4	28
H E X	18	Response	Hex	String containing the ASCII response in hex coding to match the ID above (for example, 0x4F4B = OK)	variable	32

<sup>1</sup>This ENUM is not 4-bytes long but as indicated in the table is only 1 byte.

Table 9: Binary Message Sequence

Direction	Sequence	Data

	Checksum	42DC4C48

## 1.6 GLONASS Slot and Frequency Numbers

When a GLONASS PRN in a log is in the range 38 to 61, then that PRN represents a GLONASS Slot Number where the Slot Number shown is the actual GLONASS Slot Number plus 37.

Similarly, the GLONASS Frequency shown in logs is the actual GLONASS Frequency plus 7.

For example:

```
<RANGE COM1 0 82.0 FINESTEERING 1729 155076.000 02004000 5103 11465
46
31 0 24514687.250 0.064 -128825561.494675 0.010 3877.473 45.0 563.310
18109c04
...
46 5 24097664.754 0.213 -128680178.570435 0.014 -3740.543 40.6 10098.600
08119e44
...
8 0 39844800.076 0.043 -160438471.200694 0.013 -392.547 42.5 12038.660
00349c84
```

when 31 is a GPS satellite, 8 is a BeiDou satellite and 46 is a GLONASS satellite. Its actual GLONASS Slot Number is 9 and its frequency is -2.

Refer to *PRN Numbers* on the next page for more information about GLONASS PRN numbers. Also, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss) for more information.

## 1.6.1 PRN Numbers

The PRN and SVID ranges for the logs and commands that use them are shown in the following table.

**Table 10: PRN Numbers for Commands and Logs**

Command/Log	GPS PRN	SBAS PRN	SBAS QZSS L1S PRN	GLONASS Slot	Galileo SVID	QZSS PRN	BDS PRN	NavIC PRN
ASSIGN	1-32	120-158	183-192	38-61	1-36	193-202	1-63	1-14
ASSIGNALL	1-32	120-158	183-192	38-61	1-36	193-202	1-63	1-14
LOCKOUT	1-32	120-158	183-192	38-61	-	193-202	-	1-14
SBASCONTROL	-	120-158	183-192	-	-	-	-	-
TRACKSV	1-32	120-158	183-192	38-61	1-36	193-202	1-63	1-14

TRACKSTAT	1-32	120-158	183-192	38-61	1-36	193-202	1-63	1-14

## 1.7 GPS Reference Time Status

All reported receiver times are subject to a qualifying time status. The status indicates how well a time is known (see *Table 11: GPS Reference Time Status* below).

**Table 11: GPS Reference Time Status**

GPS Reference Time Status (Decimal)	GPS Reference Time Status (ASCII)	Description
20	UNKNOWN	Time validity is unknown
60	APPROXIMATE	Time is set approximately
80	COARSEADJUSTING	Time is approaching coarse precision
100	COARSE	This time is valid to coarse precision
120	COARSESTEERING	Time is coarse set and is being steered

GPS Reference Time Status (Decimal)	GPS Reference Time Status (ASCII)	Description
130	FREEWHEELING	Position is lost and the range bias cannot be calculated
140	FINEADJUSTING	Time is adjusting to fine precision
160	FINE	Time has fine precision
170	FINEBACKUPSTEERING	Time is fine set and is being steered by the backup system
180	FINESTEERING	Time is fine set and is being steered
200	SATTIME	Time from satellite. Only used in logs containing satellite data such as ephemeris and almanac

There are several distinct states the receiver goes through.

When the **CLOCKADJUST** command (see page 103) is enabled:

- UNKNOWN (initial state)
- COARSESTEERING (initial coarse time set)
- FINESTEERING (normal operating state)
- FINEBACKUPSTEERING (when the backup system is used for a time)
- FREEWHEELING (when range bias becomes unknown)

When the **CLOCKADJUST** command (see page 103) is disabled:

- UNKNOWN (initial state)
- COARSE (initial coarse time set)
- FINE (normal operating state)

On startup and before any satellites are tracked, the receiver can not possibly know the current time. As such, the receiver time starts counting at GPS reference week 0 and second 0.0. The time status flag is set to UNKNOWN.

If time is input to the receiver using the **SETAPPROXTIME** command (see page 324), the time status will be APPROXIMATE.

After the first ephemeris is decoded, the receiver time is set to a resolution of  $\pm 10$  milliseconds. This state is qualified by the COARSE or COARSESTEERING time status flag depending on the state of the CLOCKADJUST switch (for more information, refer to the **CLOCKADJUST** command on page 103).

Once a position is known and range biases are being calculated, the internal clock model will begin modeling the range biases also known as the receiver clock offset.

Modeling will continue until the model is a good estimation of the actual receiver clock behavior. At this time, the receiver time will again be adjusted, this time to an accuracy of  $\pm 1$  microsecond. This state is qualified by the FINE time status flag.

The final logical time status flag depends on whether **CLOCKADJUST** is enabled or not. If CLOCKADJUST is disabled, the time status flag will never improve on FINE. The time will only be adjusted again to within  $\pm 1$  microsecond if the range bias gets larger than  $\pm 250$  milliseconds. If CLOCKADJUST is enabled, the time status flag is

set to **FINESTEERING** and the receiver time is continuously updated (steered) to minimize the receiver range bias.

If a solution cannot be computed with the primary satellite system, it will attempt to use a backup system (if available). When the backup system is used and time is computed, the time status is set to **FINEBACKUPSTEERING**. If the position is lost and the range bias cannot be calculated, the time status is degraded to **FREEWHEELING**.

See also *Message Time Stamps* below and the **SETTIMEBASE** command on page 334.

## 1.8 Message Time Stamps

All NovAtel format messages generated by the OEM7 receivers have a GPS reference time stamp in their header. GPS reference time is referenced to UTC with zero point defined as midnight on the night of January 5, 1980. The time stamp consists of the number of weeks since that zero point and the number of seconds since the last week number change (0 to 604,799). GPS reference time differs from UTC time since leap seconds are occasionally inserted into UTC and GPS reference time is continuous. In addition, a small error (less than 1 microsecond) can exist in synchronization between UTC and GPS reference time. The TIME log reports both GNSS and UTC time and the offset between the two.

The data in synchronous logs (for example, RANGE, BESTPOS, TIME) are based on a periodic measurement of satellite pseudoranges. The time stamp on these logs is the receiver estimate of GPS reference time at the time of the measurement.

Other log types (asynchronous and polled) are triggered by an external event and the time in the header may not be synchronized to the current GPS reference time. Logs that contain satellite broadcast data (for example, ALMANAC, GPSEPHM) have the transmit time of their last subframe in the header. In the header of differential time matched logs (for example, MATCHEDPOS) is the time of the matched reference and local observation that they are based on. Logs triggered by a mark event (for example, MARKPOS, MARK1TIME) have the estimated GPS reference time of the mark event in their header. In the header of polled logs (for example, LOGLIST, PORTSTATS, VERSION) is the approximate GPS reference time when their data was generated. However, when asynchronous logs are triggered ONTIME, the time stamp will represent the time the log was generated and not the time given in the data.

For more information about log types, see *Log Types* on page 399.

## 1.9 Decoding of the GPS Reference Week Number

The GPS reference week number provided in the raw satellite data is the 10 least significant bits (or 8 least significant bits in the case of the almanac data) of the full week number. When the receiver processes the satellite data, the week number is decoded in the context of the current era and therefore is computed as the full week number starting from week 0 or January 6, 1980. Therefore, in all log headers and decoded week number fields, the full week number is given. Only in raw data, such as the *data* field of the **RAWALM** log (see page 735) or the *subframe* field of the **RAWEPHEM** log (see page 738), will the week number remain as the 10 (or 8) least significant bits.

## 1.10 32-Bit CRC

The ASCII and Binary OEM7 family message formats all contain a 32-bit CRC for data verification. This allows the user to ensure the data received (or transmitted) is valid with a high level of certainty.

The C functions below may be implemented to generate the CRC of a block of data.

```
#define CRC32_POLYNOMIAL 0xEDB88320L
```

```

/* -----
Calculate a CRC value to be used by CRC calculation functions.
----- */
unsigned long CRC32Value(int i) {
    int j;
    unsigned long ulCRC;
    ulCRC = i;
    for ( j = 8 ; j > 0; j-- ) {
        if ( ulCRC & 1 )
            ulCRC = ( ulCRC >> 1 ) ^ CRC32_POLYNOMIAL;
        else
            ulCRC >>= 1;
    }
    return ulCRC;
}

/* -----
Calculates the CRC-32 of a block of data all at once
ulCount - Number of bytes in the data block
ucBuffer - Data block
----- */
unsigned long CalculateBlockCRC32( unsigned long ulCount, unsigned char
*ucBuffer ) {
    unsigned long ulTemp1;
    unsigned long ulTemp2;
    unsigned long ulCRC = 0;
    while ( ulCount-- != 0 ) {
        ulTemp1 = ( ulCRC >> 8 ) & 0x00FFFFFFL;
        ulTemp2 = CRC32Value( ((int) ulCRC ^ *ucBuffer++ ) & 0xFF );
        ulCRC = ulTemp1 ^ ulTemp2;
    }
    return( ulCRC );
}

```

The NMEA checksum is an XOR of all the bytes (including delimiters such as ',' but excluding the \* and \$) in the message output. It is therefore an 8-bit and not a 32-bit checksum.

Not all logs may be available. Every effort is made to ensure examples are correct, however, a checksum may be created for promptness in publication. In this case it will appear as '9999'.

#### Example:

BESTPOSB and BESTPOSA from an OEM7 receiver.

#### Binary Log Message:

```

0xAA, 0x44, 0x12, 0x1C, 0x2A, 0x00, 0x02, 0x20, 0x48, 0x00, 0x00, 0x00,
0x90, 0xB4, 0x93, 0x05, 0xB0, 0xAB, 0xB9, 0x12, 0x00, 0x00, 0x00, 0x00,
0x45, 0x61, 0xBC, 0x0A, 0x00, 0x00, 0x00, 0x00, 0x10, 0x00, 0x00, 0x00,
0x1B, 0x04, 0x50, 0xB3, 0xF2, 0x8E, 0x49, 0x40, 0x16, 0xFA, 0x6B, 0xBE,
0x7C, 0x82, 0x5C, 0xC0, 0x00, 0x60, 0x76, 0x9F, 0x44, 0x9F, 0x90, 0x40,
0xA6, 0x2A, 0x82, 0xC1, 0x3D, 0x00, 0x00, 0x00, 0x12, 0x5A, 0xCB, 0x3F,

```

```
0xCD, 0x9E, 0x98, 0x3F, 0xDB, 0x66, 0x40, 0x40, 0x00, 0x30, 0x30, 0x30,
0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x0B, 0x0B, 0x00, 0x00,
0x00, 0x06, 0x00, 0x03, 0x42, 0xdc, 0x4c, 0x48
```

Below is a demonstration of how to generate the CRC from both ASCII and BINARY messages using the function described above.

When you pass the data into the code that follows, exclude the checksum shown in *bold italics* above. It is *42dc4c48*.

### Binary Checksum Calculation:

```
#include <stdio.h>
#include <string.h>
#include <inttypes.h>

void main() {
    // Expect checksum 0x42, 0xDC, 0x4C, 0x48 (42dc4c48)
    unsigned char buffer[] = {0xAA, 0x44, 0x12, 0x1C, 0x2A, 0x00, 0x02, 0x20,
0x48, 0x00,
                                0x00, 0x00, 0x90, 0xB4, 0x93, 0x05, 0xB0, 0xAB,
0xB9, 0x12,
                                0x00, 0x00, 0x00, 0x00, 0x45, 0x61, 0xBC, 0x0A,
0x00, 0x00,
                                0x00, 0x00, 0x10, 0x00, 0x00, 0x00, 0x1B, 0x04,
0x50, 0xB3,
                                0xF2, 0x8E, 0x49, 0x40, 0x16, 0xFA, 0x6B, 0xBE,
0x7C, 0x82,
                                0x5C, 0xC0, 0x00, 0x60, 0x76, 0x9F, 0x44, 0x9F,
0x90, 0x40,
                                0xA6, 0x2A, 0x82, 0xC1, 0x3D, 0x00, 0x00, 0x00,
0x12, 0x5A,
                                0xCB, 0x3F, 0xCD, 0x9E, 0x98, 0x3F, 0xDB, 0x66,
0x40, 0x40,
                                0x00, 0x30, 0x30, 0x30, 0x00, 0x00, 0x00, 0x00,
0x00, 0x00,
                                0x00, 0x00, 0x0B, 0x0B, 0x00, 0x00, 0x00, 0x06,
0x00, 0x03};

    //Note that the CRC on the binary data will be little-endian ordered.
    unsigned long CRCle = CalculateBlockCRC32(sizeof(buffer), buffer);

    //big-endian users (such as Atmel AVR32 users) may swap endianness as
    follows
    unsigned long CRCbe = __builtin_bswap32(CRCle);

    printf("\n\n%s %lx \n", "Computed binary checksum (little-endian): ",
CRCle);
    printf("%s %" PRIx32 "\n", "Computed binary checksum (big-endian): ",
CRCbe);
}
```

Note that the above checksum function (`CalculateBlockCRC32`) must also be included to execute this code.

**ASCII Log Message:**

```
#BESTPOSA,COM1,0,78.0,FINESTEERING,1427,325298.000,00000000,6145,2748;  
SOL_COMPUTED,SINGLE,51.11678928753,-114.03886216575,1064.3470,-16.2708,  
WGS84,2.3434,1.3043,4.7300,"",0.000,0.000,7,7,0,0,0,06,0,03*9c9a92bb
```

The checksum for this log is given above, it is `9c9a92bb`.

**ASCII:**

```
#include <stdio.h>  
#include <string.h>  
  
void main() {  
    //Remember to escape " characters as \  
    char *msgBlock =  
    "BESTPOSA,COM1,0,78.0,FINESTEERING,1427,325298.000,00000000,\ \  
    6145,2748;SOL_COMPUTED,SINGLE,51.11678928753,-114.03886216575,\ \  
    1064.3470,-  
    16.2708,WGS84,2.3434,1.3043,4.7300,\"\"\",0.000,0.000,7,7,0,0,0,06,0,03";  
  
    unsigned long CRC = CalculateBlockCRC32(strlen(msgBlock), (unsigned  
char*)msgBlock);  
  
    printf("\n%s %s\n", "Demonstrating CRC computed for the block:",  
msgBlock);  
    printf("\n\n%s %lu\n", "CRC32 in Decimal is: ", CRC);  
    printf("%s %lx\n", "CRC32 in Hex is: ", CRC);  
}
```

Note that the above checksum function (`CalculateBlockCRC32`) must also be included to execute this code.

# Chapter 2 Commands

Commands are used to control and configure OEM7 receivers.

## 2.1 Command Formats

The receiver accepts commands in 3 formats as described in *Messages* on page 30:

- Abbreviated ASCII
- ASCII
- Binary

Abbreviated ASCII is the easiest to use for your input. The other two formats include a CRC for error checking and are intended for use when interfacing with other electronic equipment.

The following are examples of the same command in each format:

### Abbreviated ASCII Example:

```
LOG COM1 BESTPOSB ONTIME 1[CR]
```

### ASCII Example:

```
#LOGA,THISPORT,0,0,UNKNOWN,0,0.0,0,0,0;COM1,BESTPOSB,ONTIME,1.000000,0.000000,N  
OHOLD*ec9ce601[CR]
```

### Binary Example:

```
AA44121C 010000C0 20000000 00FF0000 00000000 00000000 00000000 20000000  
2A000000 02000000 00000000 0000F03F 00000000 00000000 00000000 34D32DC1
```

### 2.1.1 Optional Parameters

Many commands have nested optional parameters where an optional parameter requires the optional parameter before it to be present. This is noted in the Abbreviated ASCII Syntax as:

```
Command [OPT_1 [OPT_2 [OPT_3]]]
```

In this syntax example, OPT\_1 and OPT\_2 must be provided if you want to provide a value for OPT\_3. These leading two options are required even if you want to use the defaults for OPT\_1 and OPT\_2.

## 2.2 Command Settings

There are several ways to determine the current command settings of the receiver:

1. Request an **RXCONFIG** log (see page 775). This log provides a listing of all commands issued to the receiver and their parameter settings. It also provides the most complete information.
2. For some specific commands, logs are available to indicate all their parameter settings. The **LOGLIST** log (see page 593) shows all active logs in the receiver beginning with the **LOG** command (see page 215).
3. Request a log of the specific command of interest to show the parameters last entered for that command. The format of the log produced is exactly the same as the format of the specific command with updated header information.

Requesting a log for specific command is useful for most commands. For commands repeated with different parameters (for example, **SERIALCONFIG** and **LOG**), only the most recent set of parameters used is shown. To view all sets of parameters, try method 1 or 2 above.

#### Abbreviated ASCII Example:

```
log fix
<FIX COM1 0 49.5 FINESTEERING 2072 405099.446 02000008 37d7 15761
<      NONE -10000.000000000000 -10000.000000000000 -10000.0000
```

## 2.3 Command Defaults

When the receiver is first powered up or after a **FRESET** command (see page 171), all commands revert to their factory default settings. When you use a command without specifying its optional parameters, it may have a different command default than the factory default. The **SAVECONFIG** command (see page 302) can be used to save these defaults. Use the **RXCONFIG** log (see page 775) to reference any default command and log settings.

Factory default settings for individual commands are stated in the following commands, organized alphabetically by command name.

**FRESET STANDARD** causes all previously stored user configurations saved to non-volatile memory to be erased (including Saved Config, Saved Almanac, Saved Ephemeris and L-Band-related data, excluding subscription information).

Ensure that all windows, other than the Console window, are closed in NovAtel's Connect user interface application before you issue the **SAVECONFIG** command (see page 302).

## 2.4 ADJUST1PPS

### *Adjusts the receiver clock*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to adjust the receiver clock or as part of the procedure to transfer time between receivers. The number of pulses per second (PPS) is always set to 1 Hz with this command. It is typically used when the receiver is not adjusting its own clock and is using an external reference frequency.

To disable the automatic clock adjustment, refer to the **CLOCKADJUST** command on page 103. To configure the receiver to use an external reference oscillator, see the **EXTERNALCLOCK** command on page 148.

The **ADJUST1PPS** command can be used to:

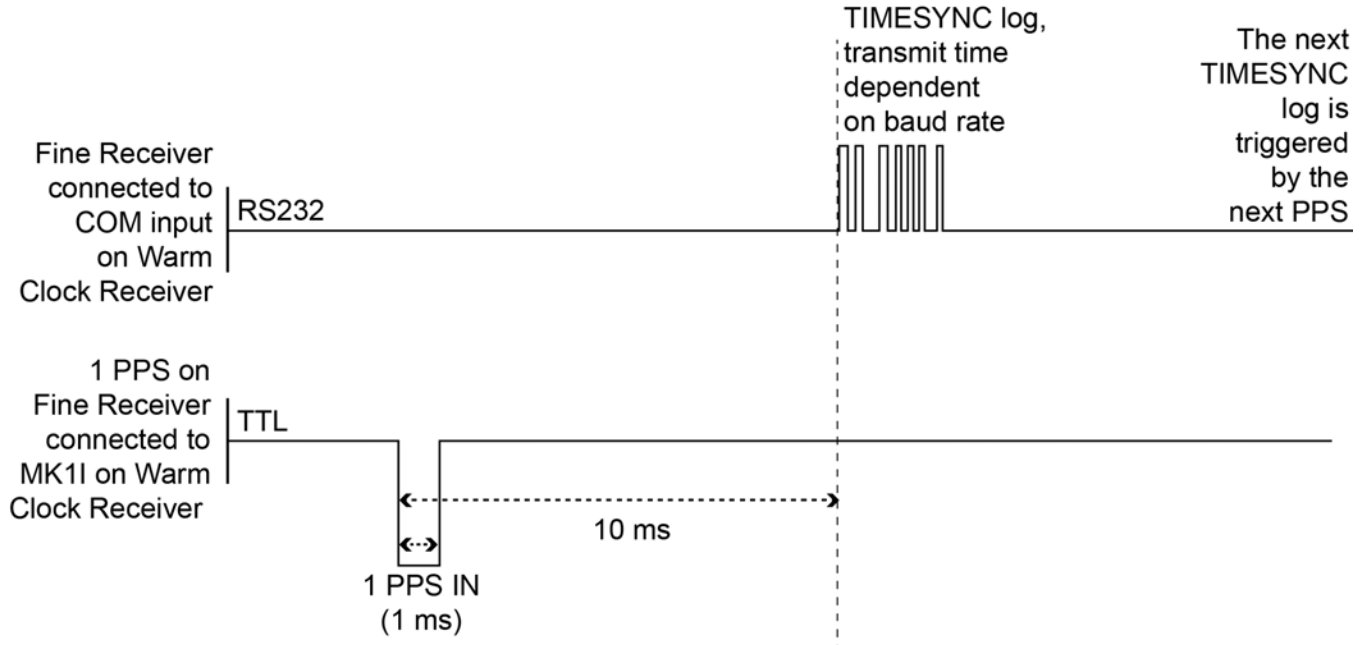

- Manually shift the phase of the clock
- Adjust the phase of the clock so the output 1PPS signal matches an external signal
- Set the receiver clock close to that of another GNSS receiver
- Set the receiver clock exactly in phase of another GNSS receiver

1. The resolution of the clock synchronization is 20 ns.
2. To adjust the 1PPS output, when the receiver's internal clock is being used and the **CLOCKADJUST** command is enabled, use the **CLOCKOFFSET** command on page 108.
3. If the 1PPS rate is adjusted, the new rate does not start until the next second begins.

Figure 2: 1PPS Alignment below shows the 1PPS alignment between a Fine and a Warm Clock receiver. See also the **TIMESYNC** log on page 857 and the *Transfer Time Between Receivers* section in the [OEM7 Installation and Operation User Manual](#).

**Figure 2: 1PPS Alignment**

The 1PPS is obtained from different receivers in different ways.

In *Figure 2: 1PPS Alignment* on the previous page, the examples are for the transfer of time. If you need position, you must be tracking satellites and your receiver must have a valid almanac.

Alternatively, the 1PPS signal can be set up to be output on a COM port using the **COMCONTROL** command (see page 110). The accuracy of the 1PPS is less using this method, but may be more convenient in some circumstances.

**Table 12: COM Port Signals Available for 1PPS**

OEM719	OEM729	OEM7600	OEM7700	OEM7720	PwrPak7	SPAN CPT7
COM1 Tx	COM1 Tx	COM1 Tx	COM1 Tx	COM1 Tx	COM1 Tx	COM1 Tx
COM2 Tx	COM2 Tx	COM2 Tx	COM2 Tx	COM2 Tx	COM2 Tx	COM2 Tx
	COM2 RTS	COM2 RTS	COM2 RTS	COM2 RTS		
	COM3 Tx	COM3 Tx	COM3 Tx	COM3 Tx	COM3 Tx	
		COM4 Tx	COM4 Tx	COM4 Tx		
		COM5 Tx	COM5 Tx	COM5 Tx		

To find out the time of the last 1PPS output signal, use the TIMESYNCA/B output message (see the **TIMESYNC** log on page 857) which can be output serially on any available COM port, for example:

```
LOG COM1 TIMESYNCA ONTIME 1
```

**Message ID: 429**

**Abbreviated ASCII Syntax:**

```
ADJUST1PPS mode [period] [offset]
```

**Factory Default:**

```
ADJUST1PPS OFF
```

**ASCII Example:**

```
ADJUST1PPS MARK CONTINUOUS 250
```

Use the **ADJUST1PPS** command to synchronize two OEM7 cards in a primary/secondary relationship to a common external clock.

At the Primary Receiver:

```
LOG COM2 TIMESYNCa ONTIME 1
```

```
INTERFACEMODE COM2 NOVATEL NOVATEL NONE
```

```
CLOCKADJUST DISABLE
```

```
EXTERNALCLOCK OCXO 10MHZ (choose rubidium, cesium or user instead and choose 5MHz instead if necessary)
```

At the Secondary Receiver:

```
INTERFACEMODE COM2 NOVATEL NOVATEL NONE
```

```
CLOCKADJUST DISABLE
```

```
ADJUST1PPS MARK (or markwithtime or time depending on your connection (see Figure 3: ADJUST1PPS Connections on the next page)
```

```
EXTERNALCLOCK OCXO 10MHZ (you can choose rubidium, cesium or user instead and choose 5MHz instead if necessary)
```

Connections:

Null modem cable connected from Primary COM2 to Secondary COM2

OCXO signal sent through a splitter to feed both the Primary and Secondary Receiver external clock inputs

Primary 1PPS connected to Secondary MKI

Connect everything before applying power. If power is applied and the OEM7 receivers have acquired satellites before the OCXO and/or 1PPS = MKI is set up, the times reported by the TIMESYNC logs still diverge. Note that after the clock model was stabilized at state 0, the time difference between the Primary and Secondary Receivers reported by the TIMESYNC log was less than 10 ns.

When connecting two receivers to transfer time, disable responses on the COM port used to connect the receivers by issuing the following command on both receivers:

```
INTERFACEMODE COM2 NOVATEL NOVATEL NONE
```

The following examples are for the transfer of time. If you need position, you must be tracking satellites and your receiver must have a valid almanac.

**Figure 3: ADJUST1PPS Connections**

`adjust1pps mark` (if Receiver 2 is not in coarsetime, the input is ignored)

`adjust1pps markwithtime` (will get to finetime)

`adjust1pps time` (will only get to coarsetime)

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ADJUST 1PPS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	See <i>Table 13: ADJUST1PPS Mode</i> on the next page		Sets the ADJUST1PPS mode.	Enum	4	H
3	period	ONCE	0	The time is synchronized only once (default). The <b>ADJUST1PPS</b> command must be reissued if another synchronization is required	Enum	4	H+4
		CONTINUOUS	1	The time is continuously monitored and the receiver clock is corrected if an offset of more than 50 ns is detected			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	offset	-2147483648 to +2147483647 (ns)		Allows the operator to shift the Secondary clock in 20 ns increments. In MANUAL mode, this command applies an immediate shift of this offset in ns to the receiver clock. In MARK and MARKWITHTIME mode, this offset shifts the receiver clock with respect to the time of arrival of the MK1I event. If this offset is zero, the Secondary aligns its 1PPS to that of the signal received in its MK1I port. For example, if this value was set to 50, then the Secondary would set its 1PPS 50 ns ahead of the input signal and if this value was set to -100 then the would set its clock to 100 ns behind the input signal. Typically, this offset is used to correct for cable delay of the 1PPS signal (default=0)	Long	4	H+8

Table 13: ADJUST1PPS Mode

ASCII Value	Binary Value	Description
OFF	0	Disables ADJUST1PPS
MANUAL	1	Immediately shifts the receivers time by the offset field in ns. The period field has no effect in this mode. This command does not affect the clock state.
MARK	2	Shifts the receiver time to align its 1PPS with the signal received in the MK1I port adjusted by the offset field in ns. The effective shift range is $\pm 0.5$ s. Only the MK1I input can be used to synchronize the 1PPS signal. Synchronization cannot be done using the MK2I input offered on some receivers.
MARKWITHTIME	3	Shifts the receiver time to align its 1PPS with the signal received in the MK1I port adjusted by the offset field in ns, and sets the receiver TOW and week number, to that embedded in a received <b>TIMESYNC</b> log (see page 857). Also sets the receiver Time Status to that embedded in the <b>TIMESYNC</b> log (see page 857), which must have arrived between 800 and 1000 ms prior to the MK1I event (presumably the 1PPS from the Primary), or it is rejected as an invalid message.  See <i>Figure 2: 1PPS Alignment</i> on page 56 and <i>TIMESYNC</i> on page 857. Also refer to the Transfer Time Between Receivers section in the <a href="#">OEM7 Installation and Operation User Manual</a> .

ASCII Value	Binary Value	Description
TIME	4	If the receiver clock is not at least COARSEADJUSTED, this command enables the receiver to COARSE adjust its time upon receiving a valid <b>TIMESYNC</b> log (see page 857) in any of the ports. The clock state embedded in the <b>TIMESYNC</b> log (see page 857) must be at least FINE or FINESTEERING before it is considered. The receiver does not use the MK11 event in this mode.

## 2.5 ALIGNAUTOMATION

### *Configures ALIGN plug-and-play feature*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command configures the ALIGN plug and play feature. Use this command to enable/disable the plug and play feature, to set the rover COM port to which master is connected, to set the baud rate for communication, to set the intended operation rate using this command and to enable/disable sending the HEADINGEXTB/HEADINGEXT2B back to the Master receiver. Refer to the NovAtel application note [APN-048: ALIGN Family of Heading Solutions](#) for details on HEADINGEXT (available on our website at [nova-tel.com/support/support-materials/application-notes](http://nova-tel.com/support/support-materials/application-notes)).

On issuing this command at the ALIGN Rover, the Rover will automatically sync with the Master and configure it to send corrections at the specified baud rate and specified data rate.

This command should only be issued at ALIGN Rover.

**Message ID:** 1323

#### Abbreviated ASCII Syntax:

```
ALIGNAUTOMATION option [comport] [baudrate] [datarate] [headingextboption]
[interfacemode]
```

#### Factory Default:

```
ALIGNAUTOMATION disable
```

#### Example:

```
ALIGNAUTOMATION enable com2 230400 10 ON
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ALIGN AUTOMATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	ENABLE	1	Enable or disable the plug-and-play feature	Enum	4	H
		DISABLE	0				
3	comport	COM1, COM2 or COM3		Rover COM port to which master is connected ( <i>Table 63: COM Port Identifiers</i> on page 318) (default=COM2)	Enum	4	H+4
4	baudrate	9600, 19200, 38400, 57600, 115200, 230400 or 460800		Intended baud rate for data transmission (default=230400)	Ulong	4	H+8

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	datarate	1, 2, 4, 5, 10 or 20		Rate (in Hz) at which heading output is required (default=10 Hz)	Ulong	4	H+12
6	headingextb option	OFF	0	Enable or disable sending HEADINGEXTB/ HEADINGEXT2B back to the Master (default=ON)	Enum	4	H+16
		ON	1				
7	interfacemode	See <i>Table 44: Serial Port Interface Modes</i> on page 191		Serial port interface mode (default=None)	Enum	4	H+20

## 2.6 ANTENNAPOWER

### *Controls power to the antenna*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command enables or disables the supply of electrical power from the internal power source of the receiver to the Low Noise Amplifier (LNA) of an active antenna. Refer to the [OEM7 Installation and Operation User Manual](#) for further information about supplying power to the antenna.

There are several bits in the receiver status that pertain to the antenna (see *Table 182: Receiver Status* on page 781). These bits indicate whether the antenna is powered and whether it is open circuited or short circuited.

**Message ID: 98**

#### **Abbreviated ASCII Syntax:**

```
ANTENNAPOWER switch
```

#### **Factory Default:**

```
ANTENNAPOWER ON
```

#### **ASCII Examples:**

```
ANTENNAPOWER ON
```

```
ANTENNAPOWER OFF
```

If a short circuit or other problem causes an overload of the current supplied to the antenna, the receiver hardware shuts down the power supplied to the antenna. To restore power, power cycle the receiver. The Receiver Status word, available in the **RXSTATUS** log (see page 777), provides more information about the cause of the problem.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ANTENNAPOWER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	switch	OFF	0	Disables antenna power On dual antenna receivers, disables antenna power for both antennas	Enum	4	H
		ON	1	Enables antenna power On dual antenna receivers, enables antenna power for both antennas			
		PRIMARY_ ON_ SECONDARY_ OFF	3	Enables primary antenna power and disables secondary antenna power <b>Note:</b> Dual antenna receivers only			
		PRIMARY_ OFF_ SECONDARY_ ON	4	Disables primary antenna power and enables secondary antenna power <b>Note:</b> Dual antenna receivers only			

The OEM7 dual antenna receivers are: OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7.

## 2.7 ANTENNATYPE

### *Store the user defined antenna type*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use the **ANTENNATYPE** command to control the storage of up to five user-defined antennas. Values are entered and interpreted according to the conventions in the IGS ANTEX format.

The current list of user-defined antennas stored by the receiver can be viewed using the **USERANTENNA** log on page 863. The **THISANTENNATYPE** command (see page 357) and **BASEANTENNATYPE** command (see page 85) control the use of the antennas in RTK.

**Message ID: 2281**

#### Abbreviated ASCII Syntax:

```
ANTENNATYPE Action AntennaType [AntennaName] [NumberOfFrequencies]
[Frequency] [NorthOffset] [EastOffset] [UpOffset] [PCVArray] ...
```

The “Number of frequencies” determines the number of frequencies for which Phase Center Offsets (PCOs) and Phase Center Variations (PCVs) are stored. For simplicity, the syntax above shows a single frequency. The ASCII Example 1 below shows two frequencies being added. PCOs and PCVs can be defined for up to 24 frequencies.

#### ASCII Example 1:

```
ANTENNATYPE ADD USER_ANTENNA_1 NOVCUSTOM 2 GPSL1 0.09 0.0 51.74 0 -0.03
-0.11 -0.20 0.23 -0.17 -0.04 0.14 0.26 0.25 0.07 -0.24 -0.54 -0.67 -0.49
-0.02 0.55 0.84 0.47 GPSL2 -1.54 1.66 52.00 0.00 0.0 0.0 -0.03 -0.13 -0.28
-0.48 -0.61 -0.56 -0.28 0.23 0.84 1.29 1.31 0.77 -0.16 -0.95 -0.81 0.97
```

#### ASCII Example 2:

```
ANTENNATYPE REMOVE USER_ANTENNA_1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ANTENNATYPE header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	Action	ADD	0	Add a user antenna	Enum	4	H
		REMOVE	1	Delete a user antenna			
3	AntennaType	<i>Table 14: User-Defined Antenna Type</i> on the next page		User defined antenna type	Enum	4	H+4
4	AntennaName			Name of the user defined antenna	Char [16]	16	H+8

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	NumberOf Frequencies			Number of frequencies for which corrections are stored	Ulong	8	H+24
6	Frequency	See Table 19: Frequency Type on page 82		The frequency for which the phase center corrections are valid.	Enum	4	H+32
7	NorthOffset			North phase center offset (millimeters) Valid range: -326.66 to 326.66	Float	4	H+36
8	EastOffset			East phase center offset (millimeters) Valid range: -326.66 to 326.66	Float	4	H+40
9	UpOffset			Up phase center offset (millimeters) Valid range: -326.66 to 326.66	Float	4	H+44
10	PCVArray			19 element array of Phase Center Variations in 5-degree elevation increments from 90 degrees elevation to 0 degrees (millimeters) Valid range: -326.66 to 326.66	Float [19]	76	H+48
11	Next Frequency = H + 32 + (Number of frequencies x 92)						

Table 14: User-Defined Antenna Type

Binary	ASCII
1001	USER_ANTENNA_1
1002	USER_ANTENNA_2
1003	USER_ANTENNA_3
1004	USER_ANTENNA_4
1005	USER_ANTENNA_5

## 2.8 APPROXPOSTIMEOUT

### *Timeout for approximate positions in the receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command sets the approximate position timeout of the receiver. Approximate positions are used upon start-up of the receiver to populate the satellite visibility lists (see **SATVIS2** log on page 795) that aid in initial acquisition of signals. By default, an approximate position times out after 150 seconds and the receiver reverts to a cold search. This command is typically used in a high dynamic application where an initial position becomes inaccurate.

**Message ID:** 1513

#### **Abbreviated ASCII Syntax:**

```
APPROXPOSTIMEOUT timeout
```

#### **Factory Default:**

```
APPROXPOSTIMEOUT 150
```

#### **ASCII Example:**

```
APPROXPOSTIMEOUT 20
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	APPROXPOSTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Timeout	0 to 86400		Timeout in seconds. Default = 150	Ulong	4	H

## 2.9 ASSIGN

### *Assigns a channel to a PRN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **ASSIGN** command should only be used by advanced users.

1. Assigning SV channel sets the forced assignment bit in the channel tracking status field which is reported in the RANGE and TRACKSTAT logs.
2. Assigning a PRN to a SV channel does not remove the PRN from the search space of the automatic searcher; only the SV channel is removed (that is, the searcher may search and lock onto the same PRN on another channel). See *Table 10: PRN Numbers for Commands and Logs* on page 48 for the PRN available for the **ASSIGN** command.
3. GLONASS SVs cannot be assigned if there is no information on GLONASS frequencies and matching slot numbers.
4. OEM7 cards have 4 channels available for SBAS. They automatically use the healthy GEO satellites with the highest elevations. Use the **ASSIGN** command to enter a GEO PRN manually.
5. The **ASSIGN** and **UNASSIGN** commands are not accepted for L-Band channels. The **ASSIGNLBANDBEAM** command (see page 75) should be used for L-Band channels.
6. Manually assigned satellites are not reported in the **RANGECMP4** log (see page 721).

This command may be used to aid in the initial acquisition of a satellite by manually overriding the automatic satellite/channel assignment and reacquisition processes. The command specifies that the indicated tracking channel search for:

- a specified satellite
- at a specified Doppler frequency
- within a specified Doppler window

The instruction remains in effect for the specified SV channel and PRN, even if the assigned satellite is below the elevation cutoff. If the satellite Doppler offset of the assigned SV channel exceeds that specified by the window parameter of the **ASSIGN** command, the satellite may never be acquired or reacquired. If a channel has been manually assigned, and the channel is changed to AUTO tracking, then the channel is idled immediately and returns to automatic mode.

To cancel the effects of **ASSIGN**, issue one of the following:

- The **ASSIGN** command with the state set to AUTO
- The **UNASSIGN** command (see page 366)
- The **UNASSIGNALL** command (see page 368)

These immediately return SV channel control to the automatic search engine

**Message ID: 27**

#### **Abbreviated ASCII Syntax:**

```
ASSIGN channel [state] [prn [Doppler [Doppler window]]]
```

**ASCII Example 1:**

```
ASSIGN 0 ACTIVE 29 0 2000
```

In example 1, the first SV channel is searching for satellite PRN 29 in a range from -2000 Hz to 2000 Hz until the satellite signal is detected.

**ASCII Example 2:**

```
ASSIGN 11 28 -250 0
```

SV channel 11 is searching for satellite PRN 28 at an offset of -250 Hz only.

**ASCII Example 3:**

```
ASSIGN 11 IDLE
```

SV channel 11 is idled and does not attempt to search for satellites.

For dual antenna receivers:

- On the primary antenna, the SV channel is from 0 to N-1, where N is the number of channels in the primary antenna channel configuration.
- On the secondary antenna, the SV channel count is from at N to N+(M-1), where M is the number of channels in the secondary antenna SV channel configuration.
- Even though L-Band channels cannot be configured with the **ASSIGN** command, they are included when determining N.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ASSIGN header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	channel	0 to n-1, where n is the maximum number of GNSS channels in the current channel configuration		Desired SV channel number where channel 0 is the first SV channel. The last channel depends on the model configuration.	Ulong	4	H
3	state	Refer to <i>Table 15: Channel State</i> on the next page		Set the SV channel state. If a value is not given, the default of ACTIVE is used when the additional optional parameters are entered.	Enum	4	H+4
4	prn	Refer to <i>PRN Numbers</i> on page 48		Optional satellite PRN number. A value must be entered unless the state parameter is IDLE or AUTO.	Ulong	4	H+8

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	Doppler	-100 000 to 100 000 Hz		Current Doppler offset of the satellite. (default=0) <b>Note:</b> Satellite motion, receiver antenna motion and receiver clock frequency error must be included in the calculation of Doppler frequency.	Long	4	H+12
6	Doppler window	0 to 10 000 Hz		Error or uncertainty in the Doppler estimate above. (default=4500) <b>Note:</b> This is a $\pm$ value. Example: 500 for $\pm$ 500 Hz	Ulong	4	H+16

Table 15: Channel State

Binary	ASCII	Description
0	IDLE	Set the SV channel to not track any satellites
1	ACTIVE <sup>1</sup>	Set the SV channel active (default)
2	AUTO	Tell the receiver to automatically assign PRN numbers to channels

<sup>1</sup>A PRN number is required when using the ACTIVE channel state in this command.

## 2.10 ASSIGNALL

### *Assigns all channels of a satellite system*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **ASSIGNALL** command should only be used by advanced users.

This command is used to override the automatic satellite channel algorithms with manual instructions for all channels in a satellite system.

**Message ID: 28**

#### Abbreviated ASCII Syntax:

```
ASSIGNALL [system][state][prn [Doppler [Doppler window]]]
```

#### ASCII Example 1:

```
ASSIGNALL GLONASS IDLE
```

In example 1, all GLONASS channels are idled, essentially stopping the receiver from tracking GLONASS.

#### ASCII Example 2:

```
ASSIGNALL GLONASS AUTO
```

In example 2, all GLONASS channels are enabled in auto mode. This enables the receiver to automatically assign channels to track the available GLONASS satellites.

This command is the same as **ASSIGN** except that it affects all SV channels of the specified satellite system.

These command examples are only applicable to specific receiver models. If the system field is used with this command and the receiver has no channels configured with that satellite system, the command is rejected.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ASSIGN-ALL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	system	See <i>Table 16: Satellite System</i> on the next page		Satellite system to assign. If no value is specified, the value defaults to ALL.	Enum	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	state	Refer to <i>Table 15: Channel State</i> on page 72)		Set the SV channel state.	Enum	4	H+4
4	prn	Refer to <i>PRN Numbers</i> on page 48		Optional satellite PRN code. A value must be entered if the state parameter is neither IDLE or AUTO.	Ulong	4	H+8
5	Doppler	-100 000 to 100 000 Hz		Current Doppler offset of the satellite. (default=0) <b>Note:</b> Satellite motion, receiver antenna motion and receiver clock frequency error must be included in the calculation of Doppler frequency.	Long	4	H+12
6	Doppler window	0 to 10 000 Hz		Error or uncertainty in the Doppler estimate above. (default=4500) <b>Note:</b> This is a $\pm$ value Example, 500 for $\pm$ 500 Hz	Ulong	4	H+16

Table 16: Satellite System

Binary	ASCII	Description
3	ALL	All systems
99	GPS	GPS system
100	SBAS	SBAS system
101	GLONASS	GLONASS system
102	GALILEO	GALILEO system
103	BEIDOU	BeiDou system
104	QZSS	QZSS system
105	NAVIC	NavIC system

GLONASS SVs cannot be assigned if there is no information on GLONASS frequencies and matching slot numbers.

## 2.11 ASSIGNLBANDBEAM

### Configure L-Band tracking

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command assigns TerraStar or Veripos beams to the L-Band channels based on the defined L-Band assignment option.

Logging the **ASSIGNLBANDBEAM** command may not display the correct values. To access the actual beam name, frequency and baud rate values, log the **LBANDTRACKSTAT** log (see page 590) or if the beam name is known, log the **LBANDBEAMTABLE** log (see page 588) and find the associated frequency and baud rate.

**Message ID:** 1733

#### Abbreviated ASCII Syntax:

```
ASSIGNLBANDBEAM [option] [name] [frequency] [baudrate] [Dopplerwindow]
```

#### Factory Default:

```
ASSIGNLBANDBEAM idle
```

#### ASCII Examples:

```
ASSIGNLBANDBEAM auto
```

```
ASSIGNLBANDBEAM 98W
```

```
ASSIGNLBANDBEAM manual 98w 1545865000 1200
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	ASSIGNLBANDBEAM header	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Option	Assignment option (see <i>Table 17: L-Band Assignment Option</i> on the next page) (manual=default)	Enum	4	H
3	Name	Beam name (empty string=default)	Char[8]	8	H+4
4	Frequency	Beam frequency in Hz (0=default)	Ulong	4	H+12
5	Baud rate	Data baud rate (0=default)	Ulong	4	H+16
6	Doppler window	Doppler window to search (6000=default)	Ulong	4	H+20

Table 17: L-Band Assignment Option

ASCII	Binary	Description
IDLE	0	Idle all L-Band channels
AUTO	1	<p>The receiver searches for multiple L-Band beams on the L-Band channels based on AUTO selection criteria.</p> <p>If the receiver position is known, the AUTO selection criteria is a ranking of granted access L-Band beams by descending elevation angle.</p> <p>If the receiver position is not known, the AUTO selection criteria is a ranking of granted access L-Band beams in the order they appear in the stored beam table (see the <b>LBANDBEAMTABLE</b> log on page 588).</p>
MANUAL	2	The receiver assigns the specified beam on the first L-BAND channel and makes the other L-BAND channels IDLE.

## 2.12 AUTH

### *Authorization code for different model*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to add or remove authorization codes from the receiver. Authorization codes are used to authorize models of software for a receiver. Models control the functionality the receiver provides. The receiver is capable of keeping track of 24 authorization codes at one time. The **MODEL** command (see page 230) can then be used to switch between authorized models. The **VALIDMODELS** command (see page 868) lists the current available models in the receiver. The **AUTHCODES** log (see page 408) lists all authorization codes entered into the receiver. This simplifies the use of multiple software models on the same receiver.

If there is more than one valid model in the receiver, the receiver either uses the model of the last auth code entered via the **AUTH** command or the model that was selected by the **MODEL** command, whichever was done last. Adding an authorization code or using the **MODEL** command causes an automatic reset of the receiver. Removing an authorization code does not cause a reset.

Removing an authorization code will cause the receiver to permanently lose this information.

**Message ID:** 49

**Abbreviated ASCII Syntax:**

```
AUTH [state] part1 part2 part3 part4 part5 model [date]
```

**Input Example:**

```
AUTH add T48JF2,W25DBM,JH46BJ,2WGHMJ,8JW5TW,G2SR0RCCR,101114
```

```
AUTH erase_table PW5W2B,WW5TM9,WW2PCZ,WW3M4H,WW4HPG,ERASE_AUTH
```

When you are ready to upgrade from one model to another, call 1-800-NOVATEL to speak with our Customer Support/Sales Personnel, who can provide the authorization code that unlocks the additional features of your GNSS receiver. This procedure can be performed at your work site and takes only a few minutes.

Receiver models can also be downgraded. This is a two step handshaking process and is best performed in a location with e-mail access.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	AUTH header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	state	See <i>Table 18: AUTH Command State</i> on the next page		Authorization code function to perform	Enum	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	part1	6 character ASCII string		Authorization code section 1	String [max. 16]	Variable <sup>1</sup>	H+4
4	part2	6 character ASCII string		Authorization code section 2	String [max. 16]	Variable <sup>1</sup>	H+20
5	part3	6 character ASCII string		Authorization code section 3	String [max. 16]	Variable <sup>1</sup>	H+36
6	part4	6 character ASCII string		Authorization code section 4	String [max. 16]	Variable <sup>1</sup>	H+52
7	part5	6 character ASCII string		Authorization code section 5	String [max. 16]	Variable <sup>1</sup>	H+68
8	model	Alpha numeric	Null terminated	Model name of the receiver	String [max. 16]	Variable <sup>1</sup>	H+84
9	date	Numeric	Null terminated	Expiry date entered as yymmdd in decimal	String [max 7]	Variable <sup>1</sup>	Variable

Table 18: AUTH Command State

ASCII	Binary	Description
REMOVE	0	Remove the authorization code from the system <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  For this parameter, the Part1-Part5 fields can be entered as 0 0 0 0 0, and only the model name entered.           </div>
ADD	1	Add the authorization code to the system (default)
ADD_DOWNLOAD	4	Add the authorization code to the system (Deprecated: Use ADD instead)
ERASE_TABLE	7	Erase all authorization codes from the system. Requires a special authorization code to prevent against accidental erasing. <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  The special authorization code required for this option is: PW5W2B,WW5TM9,WW2PCZ,WW3M4H,WW4HPG,ERASE_AUTH           </div>

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

ASCII	Binary	Description
CLEAN_ TABLE	8	<p>Remove all invalidated authorization codes from the system.</p> <p>When an authorization code is removed, it is simply invalidated and so it still uses one of the 24 spaces reserved for authorization codes in the receiver. Use the CLEAN_TABLE option to free up the spaces from removed authorization codes.</p> <div data-bbox="477 390 1451 508" style="border: 1px solid black; padding: 5px;"> The special authorization code required for this option is: 4DR69H,G369W8,34MNJJ,5NHXCJ,GW7C75,CLEAN_AUTH</div>

## 2.13 AUTOSURVEY

### *Survey for accurate position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

The **AUTOSURVEY** command uses position averaging to automatically determine the position for a base station.

When the **AUTOSURVEY** command is sent, the receiver starts position averaging. The position averaging continues until a specified accuracy level is met or until the specified survey time expires. When position averaging is complete, the calculated position is saved as the fix position for the base station. This calculated position is then used when transmitting differential corrections to the rover.

The **AUTOSURVEY** command computes the base position in WGS84.

If the **FIX** command is entered by a user, the **SAVECONFIG** command must then be issued to save to NVM. If the **FIX** command is issued by the **AUTOSURVEY** feature, the **SAVECONFIG** command does not need to be issued, because it is automatically saved to NVM.

On subsequent power ups or resets, an **AUTOSURVEY** runs to determine if the base station has moved. As the **AUTOSURVEY** runs, the average position calculated is compared to the saved fix position. If the average position is within the **AUTOSURVEY** tolerance setting, the receiver assumes it has not moved and uses the previously saved fix position. If the average position is outside of the **AUTOSURVEY** tolerance setting, the receiver assumes it has moved and will continue calculating a position average until the accuracy level is met or until the specified survey time expires.

The surveyed positions saved using the **AUTOSURVEY** command can be viewed using the **SAVEDSURVEYPOSITIONS** log on page 801. Surveyed positions can be added or deleted using the **SURVEYPOSITION** command on page 351.

**Message ID: 1795**

#### **Abbreviated ASCII Syntax:**

```
AUTOSURVEY control [time] [accuracy] [tolerance] [save_nvm] [position_id]
```

#### **Input Example:**

In the following example, the receiver is set up to survey its position for up to 24 hours or until the averaged position accuracy is 10 cm. On subsequent power ups at the same location, the survey will terminate as soon as the receiver determines the position is within 4 m of its surveyed position. Once the receiver has fixed its position, it will transmit RTCMV3 corrections over COM2.

```
SERIALCONFIG COM2 115200 N 8 1 N ON
INTERFACEMODE COM2 NONE RTCMV3 OFF
LOG COM2 RTCM1004 ONTIME 1
LOG COM2 RTCM1012 ONTIME 1
LOG COM2 RTCM1006 ONTIME 10
LOG COM2 RTCM1033 ONTIME 10
```

```
LOG COM2 RTCM1019 ONTIME 120
AUTOSURVEY ENABLE 1440 .1 4
SAVECONFIG
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	AUTOSURVEY header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	control	disable	0	Disables the self-survey feature and halts any self-survey related activity (default = disable)	Enum	4	H
		enable	1	Enables the self-survey feature			
3	time	1 - 6000 minutes		Maximum amount of time to perform self-survey (default = 1440 minutes)	Ulong	4	H+4
4	accuracy	0 - 100 meters		Desired horizontal standard deviation (default = 0.1 meters)	Float	4	H+8
5	tolerance	3 - 100 meters		Maximum distance between calculated position and saved position. During the self-survey, if the distance between the calculated position and the previously surveyed position is less than this value, the previous position is used. (default = 10 meters)	Float	4	H+12
6	save_nvm	OFF	0	Do not save position in NVM	Enum	4	H+16
		ON	1	Save position in NVM (default = ON)			
7	position_id	4 character string		ID for the saved position. If the ID is not specified or if the ID is entered as "AUTO", receiver automatically generates a unique ID for the position. <b>Note:</b> This ID is the ID for the surveyed position, not the station ID set using the <b>DGPSTXID</b> command on page 124.	String [5]	5 <sup>1</sup>	H+20

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.14 BASEANTENNAPCO

### *Sets the PCO model of the base receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use the **BASEANTENNAPCO** command to set the Phase Center Offsets (PCO) for a given frequency on the remote base receiver from which this receiver is receiving corrections. The Offsets are defined as North, East and Up from the Antenna Reference Point to the Frequency Phase Center in millimeters.

**Message ID:** 1415

#### Abbreviated ASCII Syntax:

```
BASEANTENNAPCO Frequency NorthOffset EastOffset UpOffset [CorrectionType
[StationId]]
```

#### ASCII Example:

```
BASEANTENNAPCO GPSL1 0.61 1.99 65.64
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	BASEANTENNAPCO header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Frequency	See <i>Table 19: Frequency Type</i> below		The frequency that the phase center offsets are valid for.	Enum	4	H
3	NorthOffset			NGS standard Phase Center North Offset in millimeters.	Double	8	H+4
4	EastOffset			NGS standard Phase Center East Offset in millimeters.	Double	8	H+12
5	UpOffset			NGS standard Phase Center Up Offset in millimeters.	Double	8	H+20
6	CorrectionType	See <i>Table 60: RTK Source Type</i> on page 296		Correction type (default = AUTO)	Enum	4	H+28
7	StationID	Char [8] or ANY		ID string for the base station (default = ANY)	Char	8	H+32

**Table 19: Frequency Type**

Value	Name	Description
0	GPSL1	GPS L1 frequency

Value	Name	Description
1	GPSL2	GPS L2 frequency
2	GLONASSL1	GLONASS L1 frequency
3	GLONASSL2	GLONASS L2 frequency
5	GPSL5	GPS L5 frequency
7	GALILEOE1	Galileo E1 frequency
8	GALILEOE5A	Galileo E5a frequency
9	GALILEOE5B	Galileo E5b frequency
10	GALILEOALTBOC	Galileo AltBOC frequency
11	BEIDOU1	BeiDou B1 frequency
12	BEIDOU2	BeiDou B2 frequency
13	QZSSL1	QZSS L1 frequency
14	QZSSL2	QZSS L2 frequency
15	QZSSL5	QZSS L5 frequency

## 2.15 BASEANTENNAPCV

### *Sets the PCV model of the base receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use the **BASEANTENNAPCV** command to set the Phase Center Variation (PCV) for a given frequency on the remote base receiver from which this receiver is receiving corrections. The Phase Center Variation entries follow the NGS standard and correspond to the phase elevation at 5 degree increments starting at 90 degrees and decreasing to 0.

**Message ID:** 1416

#### Abbreviated ASCII Syntax:

```
BASEANTENNAPCV Frequency [PCVArray [CorrectionType [StationId]]]
```

#### ASCII Example:

```
BASEANTENNAPCV GPSL1 0.00 -0.020 -0.07 -0.15 -0.24 -0.34 -0.43 -0.51 -0.56 -
0.61 -0.65 -0.69 -0.69 -0.62 -0.44 -0.13 0.28 0.70 1.02
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	BASEANTENNAPCV header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Frequency	See <i>Table 19: Frequency Type</i> on page 82		The frequency for which the phase center variations are valid.	Enum	4	H
3	PCVArray			NGS standard 19 element array of phase center variations, in millimeters, in 5 degree elevation increments from 90 to 0. Defaults to zero for all elevation increments.	Double [19]	152	H+4
4	CorrectionType	See <i>Table 60: RTK Source Type</i> on page 296		Correction type (default = AUTO)	Enum	4	H+156
5	StationID	Char [8] or ANY		ID string (default = ANY)	Char	8	H+160

## 2.16 BASEANTENNATYPE

*Sets the antenna type of the base receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use the **BASEANTENNATYPE** command to set the type of antenna type connected to the base receiver from which this receiver is receiving RTK corrections. There are two sources of antenna information:

- An internal table  
The firmware contains a set of predefined antenna and radome types taken from the IGS ANTEX file. Refer to *Table 20: Antenna Type* on the next page and *Table 21: Radome Type* on page 95 for the antennas currently supported.
- User-defined antennas  
User-defined antenna types can be entered using the **ANTENNATYPE** command (see page 67).

The **THISANTENNATYPE** command (see page 357) is used to set the type of antenna being used with this receiver.

**Message ID:** 1419

**Abbreviated ASCII Syntax:**

```
BASEANTENNATYPE AntennaType [RadomeType] [CorrectionType] [StationId]
```

**ASCII Examples:**

```
BASEANTENNATYPE NOV702
```

```
BASEANTENNATYPE USER_ANTENNA_1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	BASEANTENNATYPE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	AntennaType	See <i>Table 20: Antenna Type</i> on the next page or <i>Table 14: User-Defined Antenna Type</i> on page 68		Antenna type	Enum	4	H
3	RadomeType	See <i>Table 21: Radome Type</i> on page 95		Radome type (default = NONE)	Enum	4	H+4
4	CorrectionType	See <i>Table 60: RTK Source Type</i> on page 296		Correction type (default = AUTO)	Enum	4	H+8
5	StationID	Char [8] or ANY		Base station ID (default = ANY)	Char	8	H+12

The latest information can be obtained from the National Geodetic Survey (NGS) site [www.ngs.noaa.gov/ANTCAL](http://www.ngs.noaa.gov/ANTCAL).

## 2.17 BDSECUTOFF

### *Sets elevation cut-off angle for BeiDou satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the elevation cut-off angle for tracked BeiDou satellites. The receiver does not start automatically searching for a BeiDou satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the BDSECUTOFF angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle; it could be used in these situations:

- The antenna is at a high altitude, and thus can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **BDSECUTOFF** command because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command on page 140 to set the cut-off angle for all other systems.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

**Message ID:** 1582

**Abbreviated ASCII Syntax:**

```
BDSECUTOFF angle
```

**Factory Default:**

```
BDSECUTOFF 5.0
```

**ASCII Example:**

```
BDSECUTOFF 10.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	BDSECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.18 BESTVELTYPE

**Sets the velocity used in the BESTVEL and GPVTG logs**

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command configures the source of the velocity that is output in the BESTVEL and GPVTG logs. Set the type to something other than BESTPOS when an unchanging velocity source with specific characteristics is needed.

The Doppler velocity is the highest-availability, lowest-latency velocity available from the receiver. Due to its low latency, it is also the noisiest velocity.

**Message ID: 1678**

**Abbreviated ASCII Syntax:**

```
BESTVELTYPE mode
```

**Factory Default:**

```
BESTVELTYPE bestpos
```

**ASCII Example:**

```
BESTVELTYPE doppler
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BESTVELTYPE header	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	Velocity type (see <i>Table 22: Velocity Types</i> below)	Enum	4	H

**Table 22: Velocity Types**

ASCII	Binary	Description
BESTPOS	1	Use the velocity from the same positioning filter that is being used to fill BESTPOS and GPGGA
DOPPLER	2	Always fill BESTVEL and GPVTG using Doppler-derived velocities

## 2.19 CANCONFIG

### Configure CAN ports

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use the CANCONFIG command to configure the hardware parameters of the CAN ports.

**Message ID: 884**

#### Abbreviated ASCII Syntax:

```
CANCONFIG port switch [speed]
```

#### Factory Default:

```
CANCONFIG CAN1 OFF 250K
```

```
CANCONFIG CAN2 OFF 250K
```

#### ASCII Example:

```
CANCONFIG CAN1 OFF 500K
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CANCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	CAN1	1	Physical CAN port ID <b>Note:</b> The OEM7500 supports the CAN2 port only.	Enum	4	H
		CAN2	2				
3	switch	ON	1	Sets the port to be On or Off the CAN bus	Enum	4	H+4
		OFF	0				
4	speed	See <i>Table 23: CAN Port Speed</i> below		Physical CAN port speed (bits per second) (default = 250K)	Enum	4	H+8

The CAN port must be set to OFF (using `CANCONFIG <port> OFF`) before the port speed can be changed.

**Table 23: CAN Port Speed**

ASCII Value	Binary Value
10K	0
20K	1

<b>ASCII Value</b>	<b>Binary Value</b>
50K	2
100K	3
125K	4
250K	5
500K	6
1M	7

## 2.20 CCOMCONFIG

### Configure the CAN COM port

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Bind a CAN communication port to a J1939 node (see **J1939CONFIG** command on page 211) and specify the CAN protocol, PGN, priority and address for messages transmitted and received over the CCOM port.

**Message ID: 1902**

#### Abbreviated ASCII Syntax:

```
CCOMCONFIG port node protocol [pgn [priority [address]]]
```

#### Factory Default:

```
CCOMCONFIG ccom1 node1 J1939 61184 7 fe
CCOMCONFIG ccom2 node2 J1939 61184 7 fe
CCOMCONFIG ccom3 node1 J1939 126720 7 fe
CCOMCONFIG ccom4 none none 0 0 0
CCOMCONFIG ccom5 none none 0 0 0
CCOMCONFIG ccom6 none none 0 0 0
```

#### ASCII Example :

```
ccomconfig ccom1 node1 j1939 1792 6 1b
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CCOMCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	CCOM1	38	Name of CCOM port.	Enum	4	H
		CCOM2	39				
		CCOM3	40				
		CCOM4	41				
		CCOM5	42				
		CCOM6	43				
3	node	NODE1	1	The J1939 node to use. This binds a CCOM port to the CAN NAME/address associated with the node.	Enum	4	H+4
		NODE2	2				

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	protocol	See Table 24: CAN Protocol below		CAN transport protocol to use.	Enum	4	H+8
5	pgn	0 - 131071		Any valid PGN as defined by the J1939 protocol. All messages transmitted over this CCOM port will contain this PGN value. Only messages with this PGN will be received on this CCOM port. <b>Note:</b> This value is ignored if the protocol is NMEA2000.	Ulong	4	H+12
6	priority	0-7		Default CAN message priority for transmitted messages. (Priority 0 is the highest priority) <b>Note:</b> This value is ignored if the protocol is NMEA2000.	Uchar	1	H+16
7	address	00 – FF		<b>00 – FD:</b> Transmit and receive messages to/from this address only. <b>FE:</b> Transmit and receive message to/from the address of the first message received. <b>FF:</b> Broadcast messages and receive messages from all addresses. <b>Note:</b> This value is ignored if the protocol is NMEA2000.	Hex	1	H+17

Table 24: CAN Protocol

Binary	ASCII	Description
2	J1939	J1939 single packet
3	NMEA2000	NMEA2000 (single packet, multi-packet, fast packet)
5	ISO11783	ISO 11783 transport protocol

## 2.21 CLOCKADJUST

### *Enables clock adjustments*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

All oscillators have some inherent drift. By default, the receiver attempts to steer the receiver's clock to accurately match GPS reference time. Use the **CLOCKADJUST** command to disable this function. The **TIME** log can then be used to monitor clock drift.

The **CLOCKADJUST** command should only be used by advanced users.

1. If the **CLOCKADJUST** command is **ENABLED** and the receiver is configured to use an external reference frequency (set in the **EXTERNALCLOCK** command (see page 148) for an external clock - TCXO, OCXO, RUBIDIUM, CESIUM, or USER), then the clock steering process takes over the VARF output pins and may conflict with a previously entered **EVENTOUTCONTROL** command (see page 146).
2. When using the **EXTERNALCLOCK** and **CLOCKADJUST** commands together, issue the **EXTERNALCLOCK** command (see page 148) first to avoid losing satellites.
3. When disabled, the range measurement bias errors continue to accumulate with clock drift.
4. Pseudorange, carrier phase and Doppler measurements may jump if the **CLOCKADJUST** mode is altered while the receiver is tracking.
5. When disabled, the time reported on all logs may be offset from GPS reference time. The 1PPS output may also be offset. The amount of this offset may be determined from the **TIME** log (see page 854).
6. A discussion on GPS reference time may be found in *GPS Reference Time Status* on page 48.

**Message ID:** 15

**Abbreviated ASCII Syntax:**

```
CLOCKADJUST switch
```

**Factory Default:**

```
CLOCKADJUST ENABLE
```

**ASCII Example:**

```
CLOCKADJUST DISABLE
```

The **CLOCKADJUST** command can be used to calibrate an internal oscillator. Disable the **CLOCKADJUST** mode in order to find out what the actual drift is from the internal oscillator. Watch the **CLOCKMODEL** log to see the drift rate and adjust the oscillator until the drift stops.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CLOCKADJUST header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disallow adjustment of internal clock	Enum	4	H
		ENABLE	1	Allow adjustment of internal clock			

## 2.22 CLOCKCALIBRATE

### *Adjusts clock steering parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to adjust the control parameters of the clock steering loop. The receiver must be enabled for clock steering before these values can take effect. Refer to the **CLOCKADJUST** command on page 103 to enable or disable clock steering.

To disable the clock steering process, issue the **CLOCKADJUST DISABLE** command.

The current values used by the clock steering process are listed in the **CLOCKSTEERING** command (see page 458).

The values entered using the **CLOCKCALIBRATE** command are saved to non-volatile memory (NVM). To restore the values to their defaults, the **FRESET CLKCALIBRATION** command must be used. Issuing FRESET without the CLKCALIBRATION parameter will not clear the values (see **FRESET** command on page 171 for more details).

**Message ID:** 430

#### **Abbreviated ASCII Syntax:**

```
CLOCKCALIBRATE [mode] [period] [pulsewidth] [slope] [bandwidth]
```

#### **ASCII Example:**

```
CLOCKCALIBRATE AUTO
```

The receiver by default steers its INTERNAL VCTCXO but can be commanded to control an EXTERNAL reference oscillator. Use the **EXTERNALCLOCK** command (see page 148) to configure the receiver to use an external reference oscillator. If the receiver is configured for an external reference oscillator and configured to adjust its clock, then the clock steering loop attempts to steer the external reference oscillator through the use of the VARF signal. Note that the clock steering control process conflicts with the manual **EVENTOUTCONTROL** command (see page 146) and **FREQUENCYOUT** command (see page 168). It is expected that the VARF signal is used to provide a stable reference voltage by the use of a filtered charge pump type circuit (not supplied).

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CLOCK CALIBRATE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	mode	SET	0	Sets the period, pulsewidth, slope and bandwidth values into NVM for the currently selected steered oscillator. (INTERNAL or EXTERNAL)	Enum	4	H
		AUTO	1	Forces the receiver to do a clock steering calibration to measure the slope (change in clock drift rate with a 1 bit change in pulse width) and required pulsewidth to zero the clock drift rate. After the calibration, these values along with the period and bandwidth are entered into NVM and are then used from this point forward on the selected oscillator.			
		OFF	2	Terminates a calibration process currently underway. (default)			
3	period	0 to 262144		Signal period in 10 ns steps. Frequency Output = 100,000,000 / Period (default=11000)	Ulong	4	H+4
4	pulsewidth	The valid range for this parameter is 10% to 90% of the period		Sets the initial pulse width that should provide a near zero drift rate from the selected oscillator being steered. The valid range for this parameter is 10% to 90% of the period. If this value is not known, (in the case of a new external oscillator) then it should be set to ½ the period and the mode should be set to AUTO to force a calibration. (default=6600)	Ulong	4	H+8

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	slope			This value should correspond to how much the clock drift changes with a 1 bit change in the pulsewidth m/s/bit. The default values for the slope used for the INTERNAL and EXTERNAL clocks is -2.0 and -0.01 respectively. If this value is not known, then its value should be set to 1.0 and the mode should be set to AUTO to force a calibration. Once the calibration process is complete and using a slope value of 1.0, the receiver should be recalibrated using the measured slope and pulsewidth values (see the <b>CLOCKSTEERING</b> log on page 458). This process should be repeated until the measured slope value remains constant (less than a 5% change). (default=0.774)	Float	4	H+12
6	bandwidth			This is the value used to control the smoothness of the clock steering process. Smaller values result in slower and smoother changes to the receiver clock. Larger values result in faster responses to changes in oscillator frequency and faster start up clock pull in. The default values are 0.03 and 0.001 Hz respectively for the INTERNAL and EXTERNAL clocks. (default=0.03)	Float	4	H+16

## 2.23 CLOCKOFFSET

### *Adjusts for delay in 1PPS output*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to remove a delay in the PPS output. The PPS signal is delayed from the actual measurement time due to two major factors:

- A delay in the signal path from the antenna to the receiver
- An intrinsic delay through the RF and digital sections of the receiver

The second delay is automatically accounted for by the receiver using a nominal value determined for each receiver type. However, since the delay from the antenna to the receiver cannot be determined by the receiver, an adjustment cannot automatically be made. The **CLOCKOFFSET** command can be used to adjust for this delay.

For dual antenna receivers, a **CLOCKOFFSET\_1** command should be issued to adjust for delay on the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the message is for the second antenna. To issue an ASCII message, enter **CLOCKOFFSETA\_1**.

**Message ID:** 596

**Abbreviated ASCII Syntax:**

```
CLOCKOFFSET offset
```

**Factory Default:**

```
CLOCKOFFSET 0
```

**ASCII Example:**

```
CLOCKOFFSET -15
```

There may be small variances in the delays for each cable or card. The **CLOCKOFFSET** command can be used to characterize each setup. For example, for a cable with a delay of 10 ns, the offset can be set to -10 to remove the delay from the PPS output.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CLOCKOFFSET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	offset	±2000		Specifies the offset in nanoseconds	Long	4	H

## 2.24 CNOUPDATE

### *Sets the C/No update rate*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to set the C/No update rate.

**Message ID:** 849

**Abbreviated ASCII Syntax:**

```
CNOUPDATE rate
```

**Factory Default:**

```
CNOUPDATE default
```

**ASCII Example:**

```
CNOUPDATE 20Hz
```

Use the **CNOUPDATE** command for higher resolution update rate of the C/No measurements of the incoming GNSS signals. By default, the C/No values are calculated at approximately 4 Hz but this command allows you to increase that rate to 20 Hz.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CNOUPDATE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	rate	DEFAULT	0	Default 4 Hz C/No update rate	Enum	4	H
		20HZ	1	20 Hz C/No update rate			

## 2.25 COMCONTROL

### *Controls the serial port hardware control lines*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720

This command is used to control the hardware control lines of the serial communication (COM) ports. The TOGGLEPPS mode of this command is typically used to supply a timing signal to a host PC computer by using the RTS and DTR lines. The accuracy of controlling the COM control signals is better than 900  $\mu$ s. The other modes are typically used to control custom peripheral devices.

1. If handshaking is disabled, any of these modes can be used without affecting regular serial communications through the selected COM port. However, if handshaking is enabled, it may conflict with handshaking of the selected COM port, causing unexpected results.
2. The PULSEPPSLOW control type cannot be issued for a TX signal.
3. Only PULSEPPSHIGH, FORCEHIGH and FORCELOW control types can be used for a TX signal.
4. To use the COM2 flow control signals, COM5 must be disabled. See OEM7600, OEM7700 and OEM7720 Multiplexed Port in the [OEM7 Installation and Operation User Manual](#) for more information.

**Message ID: 431**

#### Abbreviated ASCII Syntax:

```
COMCONTROL [port] [signal] [control]
```

#### Factory Default:

```
COMCONTROL COM1 RTS DEFAULT
COMCONTROL COM2 RTS DEFAULT
COMCONTROL COM3 RTS DEFAULT
COMCONTROL COM4 RTS DEFAULT
COMCONTROL COM5 RTS DEFAULT
```

#### ASCII Example 1:

```
SERIALCONFIG COM1 9600 N 8 1 N (to disable handshaking)
COMCONTROL COM1 RTS FORCELOW
```

#### ASCII Example 2:

```
COMCONTROL COM1 RTS TOGGLEPPS
COMCONTROL COM2 RTS TOGGLEPPS
```

#### ASCII Example 3:

To set a break condition on COM1:

```
COMCONTROL COM1 TX FORCELOW
```

A break condition remains in effect until it is cleared. To clear a break condition on COM1:

```
COMCONTROL COM1 TX DEFAULT
```

or

```
COMCONTROL COM1 TX FORCEHIGH
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	COM CONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	COM1	1	Serial port to control.	Enum	4	H
		COM2	2				
		COM3	3				
		COM4	19				
		COM5	31				
3	signal	RTS	0	COM signal to control. The controllable COM signals are RTS, DTR and TX. (Default = RTS)  See also <i>Table 25: Tx, DTR and RTS Availability</i> on the next page	Enum	4	H+4
		DTR	1				
		TX	2				
4	control	DEFAULT	0	Disables this command and returns the COM signal to its default state (Default)	Enum	4	H+8
		FORCEHIGH	1	Immediately forces the signal high			
		FORCELOW	2	Immediately forces the signal low			
		TOGGLE	3	Immediately toggles the current state of the signal			
		TOGGLEPPS	4	Toggles the state of the selected signal within 900 $\mu$ s after each 1PPS event. The state change of the signal lags the 1PPS by an average value of 450 $\mu$ s. The delay of each pulse varies by a uniformly random amount less than 900 $\mu$ s			
		PULSEPPSLOW	5	Pulses the line low at a 1PPS event and to high 1 ms after it. Not for TX			
		PULSEPPSHIGH	6	Pulses the line high for 1 ms at the time of a 1PPS event			

**Table 25: Tx, DTR and RTS Availability**

## 2.26 CONFIGCODE

### Configuration Code

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Configuration Codes can be used to make permanent changes to a receiver. These are configurations that persist even after non-volatile memory is cleared.

A configuration code is different from an auth code, which controls the functionality the receiver firmware provides.

This command writes to and reads from non-volatile memory. Therefore, it is required that the receiver maintain power throughout the execution of this command. Loss of power during this critical step could result in an unrecoverable error.

**Message ID: 1041**

**Abbreviated ASCII Syntax:**

```
CONFIGCODE [action] data1 data2 data3 data4 data5 description
```

**Input Example:**

```
CONFIGCODE ERASE_TABLE WJ4HDW,GM5Z99,T2M7DP,KG2T8T,KF7GKR, TABLECLEAR
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	CONFIGCODE header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	action	See <i>Table 26: Configuration Actions</i> on the next page		Configuration action Default = ADD	Enum	4	H
3	data1			First data block	String [15]	Max. 16	H+4
4	data2			Second data block	String [15]	Max. 16	Variable
5	data3			Third data block	String [15]	Max. 16	Variable
6	data4			Fourth data block	String [15]	Max. 16	Variable
7	data5			Fifth data block	String [15]	Max. 16	Variable

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
8	description			Description of the config code	String [15]	Max. 16	Variable

In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

**Table 26: Configuration Actions**

Binary Value	ASCII Value	Description
0	REMOVE	Invalidate the specified configuration code.
1	ADD	Add the specified configuration code. (default)
3	ADD_NO_RESET	Add the specified configuration code without resetting the receiver.
7	ERASE_TABLE	Erase the entire configuration code table. This will only work with config code WJ4HDW, GM5Z99, T2M7DP, KG2T8T, KF7GKR, TABLECLEAR
8	CLEAN_TABLE	Clear the table of invalid configuration codes. This will only work with config code: 6296CN, W27KNX, W2MD4H, W5JBKG, W3BFPN, CLEAN_CONFIG.

## 2.27 DATADECODESIGNAL

### *Enable/Disable navigation data decoding for GNSS signal*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to enable or disable framing and decoding of the navigation message for each GNSS signal. When disabled, the receiver will no longer output raw frame data, ephemeris or almanac data from that signal. Signals which do not yet have the built in capability to output raw frame data are not configurable. Note that if a primary signal such as GPSL1CA is disabled, it may cause the receiver to no longer function normally because this signal's data is essential for setting receiver time and computing positions.

The default setting for each GNSS signal, and which signals can be configured, is available in *Table 27: GNSS Signal Default and Configurability* below. The table also lists if the signal's navigation message is used to compute the satellite position. For the binary value and a longer description for each signal, see *Table 28: Signal Type* on page 117.

**Table 27: GNSS Signal Default and Configurability**

Signal	Primary Signal	Default	Configurable	Used for satellite positioning
GPSL1C	No	Disabled	No	No
GPSL1CA	Yes	Enabled	Yes	Yes
GPSL2Y	No	Disabled	No	No

## 2.28 DATUM

### Select a datum transformation

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to select the ellipsoid used for converting Cartesian co-ordinates to geodetic (latitude, longitude and height) and the transformation applied to positions calculated by the receiver before they are output.

The datum transformation selected by this command will be applied to **all** solutions calculated by the receiver. Solutions based on corrections, like RTK or pseudorange differential, will naturally be in the datum of the corrections; for example, RTK networks in North America will transmit corrections that position users in NAD83. Uncorrected solutions, meanwhile, will be in WGS84 or a datum closely-aligned to it. If different solutions are in different datums then a single transformation will not work in all cases. Care must therefore be taken when using this command.

With RTK, it is normally intended to position in the datum of the base station. A transformation applied to the natural solution will shift the solution out of the base station datum. Consequently, this command is generally not suitable for use with RTK.

Use of the factory default datum of WGS84 will result in no transformation being applied to any solution. User defined datums can also be used, after being created using the **USERDATUM** command (see page 378) or **USEREXPDATUM** command (see page 380).

Datum transformations matter mostly for precise solutions like PPP and RTK, where the difference between datums is large relative to the solution accuracy. As already outlined, RTK solutions are, typically, already in the desired datum. Therefore, in most cases only PPP solutions will need transforming. To transform only the PPP solution, use the **OUTPUTDATUM** command on page 246.

Do not mix the **DATUM USER** and **OUTPUTDATUM** commands.

**Message ID:** 160

**Abbreviated ASCII Syntax:**

DATUM datum

**Factory Default:**

DATUM WGS84

**ASCII Example:**

DATUM USER

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	DATUM header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	datum	WGS84	61	World Geodetic System 84	Enum	4	H
		USER	63	User defined datum set by the <b>USERDATUM</b> command (see page 378) and <b>USEREXPDATUM</b> command (see page 380).			

## 2.29 DATUMTRANSFORMATION

### *Set user-defined datum transformation parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to add or remove user-defined datum transformations. Each entry converts from one geodetic datum in the **GEODETICDATUMS** list to another. Generally, "From" is the native service datum for one of the position types, such as ITRF2014 for TerraStar or Veripos, and "To" is a desired output datum. Entries are indexed by the pair "From" "To".

The **OUTPUTDATUM** command (see page 246) must be sent for any user-defined transformations to take effect.

The receiver firmware includes a default set of datum transformations. These default transformations cannot be deleted, but can be overwritten with user-defined parameters. A default transformation that has been overwritten can be reverted to the default parameters by deleting the transformation. User-defined transformations will persist a factory reset; all user-defined transformations can be removed by sending **FRESET USER\_DATUM\_TRANSFORMATION** (see the **FRESET** command on page 171).

The transformation used by this command is the 7 parameter Helmert transformation:

$$\begin{bmatrix} X_s \\ Y_s \\ Z_s \end{bmatrix} = \begin{bmatrix} T_x \\ T_y \\ T_z \end{bmatrix} + (1 + s) \begin{bmatrix} 1 & -R_z & R_y \\ R_z & 1 & -R_x \\ -R_y & R_x & 1 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \end{bmatrix}$$

Where:

**X, Y, Z** are the coordinates in the input datum

**X<sub>s</sub>, Y<sub>s</sub>, Z<sub>s</sub>** are the coordinates in the output datum

**T<sub>x</sub>, T<sub>y</sub>, T<sub>z</sub>** are the translation parameters corrected for translation rate (meters)

**R<sub>x</sub>, R<sub>y</sub>, R<sub>z</sub>** are the rotation parameters corrected for rotation rate (radians)

**s** is the scale difference corrected for scale rate (unitless)

A given parameter P is corrected for rate:

$$P(t) = P(t_r) + \dot{P}(t_r)(t - t_r)$$

Where:

**t<sub>r</sub>** is the reference epoch of the parameters

**t** is the current epoch

**P(t<sub>r</sub>)** is the parameter at the reference epoch

**Ḑ(t<sub>r</sub>)** is the rate of the parameter at the reference epoch

The entry contains the reference epoch, value of each parameter at the reference epoch and rate of each parameter at the reference epoch. Both the user-defined and default transformations are reported by the **DATUMTRANSFORMATIONS** log (see page 461).

**Message ID: 2297**

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
13	tx_vel			Translation rates (meters/year)	Float	4	Variable
14	ty_vel				Float	4	Variable
15	tz_vel				Float	4	Variable
16	rx_vel			Rotation rates (milliarcsecond/year)	Float	4	Variable
17	ry_vel				Float	4	Variable
18	rz_vel				Float	4	Variable
19	scale_vel			Scale difference rate (parts per billion/year)	Float	4	Variable

## 2.30 DGPSTXID

### Sets DGPS station ID

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the station ID value for the receiver when it is transmitting corrections. This allows for the easy identification of which base station was the source of the data.

For example, if you want to compare RTCM and RTCMV3 corrections, you would be easily able to identify their base stations by first setting their respective DGPSTXID values.

If **DGPSTXID AUTO** is sent, the Base Station ID String (field 3) is mandatory, but any ID entered is always replaced by **ANY**.

**Message ID:** 144

**Abbreviated ASCII Syntax:**

```
DGPSTXID type ID
```

**Factory Default:**

```
DGPSTXID auto ANY
```

**ASCII Examples:**

```
DGPSTXID RTCM 2 - using an RTCM type and ID
```

```
DGPSTXID CMR 30 - using a CMR type and ID
```

```
DGPSTXID CMR ANY - using the default CMR ID
```

```
DGPSTXID RTCA d36d - using an RTCA type and ID
```

```
DGPSTXID RTCMV3 2050 - using an RTCMV3 type and ID
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	DGPSTXID header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	RTCM	0	See <i>Table 60: RTK Source Type</i> on page 296	Enum	4	H
		RTCA	1				
		CMR	2				
		AUTO	10				
		RTCMV3	13				
		NOVATELX	14				
3	ID	Char[5]		Base Station ID String or ANY	Char[5]	8	H+4

## 2.31 DIFFCODEBIASCONTROL

*Enables/disables satellite differential code biases*

The **DIFFCODEBIASCONTROL** command has been deprecated. To disable differential code biases, use the **SETDIFFCODEBIASES** command (see page 328). to set the biases to zero.

**Message ID: 913**

## 2.32 DLLTIMECONST

### *Sets carrier smoothing*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command sets the amount of carrier smoothing performed on the code measurements. An input value of 100 corresponds to approximately 100 seconds of smoothing. Upon issuing the command, the locktime (amount of continuous tracking in seconds) for all tracking satellites is reset to zero and each code smoothing filter is restarted. You must wait for at least the length of smoothing time for the new smoothing constant to take full effect. The optimum setting for this command depends on the application.

1. This command may not be suitable for every GNSS application.
2. When using DLLTIMECONST in differential mode with the same receivers, the same setting should be used at both the base and rover station. If the base and rover stations use different types of receivers, it is recommended that you use the command default value at each receiver (DLLTIMECONST <signaltype> 100).
3. There are several considerations when using the DLLTIMECONST command:
  - The attenuation of low frequency noise (multipath) in pseudorange measurements
  - The effect of time constants on the correlation of phase and code observations
  - The rate of “pulling-in” of the code tracking loop (step response)
  - The effect of ionospheric divergence on carrier smoothed pseudorange (ramp response)
4. To get unsmoothed pseudorange measurements, choose 0 as the time constant.

The primary reason for applying carrier smoothing to the measured pseudoranges is to mitigate the high frequency noise inherent in all code measurements. Adding more carrier smoothing by increasing the DLLTIMECONST value filters out lower frequency noise, including some multipath frequencies.

There are also some adverse effects of higher DLLTIMECONST values on some performance aspects of the receiver. Specifically, the time constant of the tracking loop is directly proportional to the DLLTIMECONST value and affects the degree of dependence between the carrier phase and pseudorange information. Carrier phase smoothing of the code measurements (pseudoranges) is accomplished by introducing data from the carrier tracking loops into the code tracking system. Phase and code data, collected at a sampling rate greater than about 3 time constants of the loop, are correlated (the greater the sampling rate, the greater the correlation). This correlation is not relevant if only positions are logged from the receiver, but is an important consideration if the data is combined in some other process such as post-mission carrier smoothing. Also, a narrow bandwidth in a feedback loop impedes the ability of the loop to track step functions. Steps in the pseudorange are encountered during initial lock-on of the satellite and when working in an environment conducive to multipath. A low DLLTIMECONST value allows the receiver to effectively adapt to these situations.

Also, increased carrier smoothing may cause problems when satellite signals are strongly affected by the ionosphere. The rate of divergence between the pseudoranges and phase-derived ranges is greatest when a satellite is low in the sky since the GPS signal must travel through a much “thicker” ionosphere. The tracking error of the receiver is greatest at these times when a lot of carrier smoothing is implemented. In addition, changing periods of ionospheric activity (diurnal changes and the 11-year cycle) influences the impact of large DLLTIMECONST values. It is important to realize that the advantages of carrier smoothing do not come without some trade off in receiver performance. The factory default DLLTIMECONST value of 100 was selected as an optimal compromise of the above considerations. For the majority of applications, this default value should be appropriate. However, the flexibility exists to adjust the parameter for specific applications by users who are familiar with the consequences.

## 2.33 DNSCONFIG

### *Manually configures Ethernet DNS servers*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This command is part of the Ethernet set up. It is used to configure the Domain Name Servers (DNS) so that host names can be used instead of IP addresses.

The **DNSCONFIG** command configures a DNS server for the Ethernet interface, ETHA.

The **DNSCONFIG** command will fail if the IP address for the Ethernet interface, ETHA, is configured to use DHCP. Ensure the IP address for the Ethernet interface is configured to use a static IP address before entering the **DNSCONFIG** command.

When using DHCP, the DNS server received using DHCP is used and the DNS server configured by **DNSCONFIG** is ignored.

**Message ID:** 1244

#### Abbreviated ASCII Syntax:

```
DNSCONFIG NumDNSSservers IP
```

#### Factory Default:

```
DNSCONFIG 0
```

#### ASCII Example:

```
DNSCONFIG 1 192.168.1.5
```

Field	Field Type	ASCII Value	Binary Value	Data Description	Format	Binary Bytes	Binary Offset
1	DNSCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	NumDNSServers	0	0	Number of DNS servers If this field is set to 0, an IP address is not required.	Enum	4	H
		1	1				
3	IP	ddd.ddd. ddd.ddd		IP address of primary DNS server	String [16]	variable 1	H+4

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.34 DOPPLERWINDOW

### *Change the behavior of the doppler search*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Change the behavior of the doppler search for automatic channel assignments in the receiver. This command is used where the SV doppler may be outside of the normal receiver doppler search window of +/-16000 Hz.

The **DOPPLERWINDOW** command should only be used by advanced users.

**Message ID:** 1512

#### **Abbreviated ASCII Syntax:**

```
DOPPLERWINDOW system setting doppler_window
```

#### **Factory Default:**

```
DOPPLERWINDOW ALL AUTO 0
```

#### **ASCII Example:**

```
DOPPLERWINDOW GPS USER 20000
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Value	Binary Offset
1	DOPPLERWINDOW header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	system	See <i>Table 30: Satellite System</i> on the next page		Satellite system to configure.	Enum	4	H

## 2.35 DUALANTENNAALIGN

### *Dual Antenna ALIGN configuration*

**Platform:** OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2, SPAN CPT7

Use this command to enable or disable ALIGN and configure the ALIGN operation rates on a dual antenna receiver.

**Message ID:** 1761

**Abbreviated ASCII Syntax:**

```
DUALANTENNAALIGN switch [obsrate] [posrate]
```

**Factory Default:**

```
DUALANTENNAALIGN enable 1 1
```

**Example:**

```
DUALANTENNAALIGN enable 10 1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	DUALANTENNA ALIGN header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	Switch	DISABLE	0	Disable the dual antenna ALIGN feature	Enum	4	H
		ENABLE	1	Enable the dual antenna ALIGN feature			
3	obsrate	1, 2, 4, 5, 10, 20		Rate in Hz at which heading output is required (default = 1 Hz)	Ulong	4	H+4
4	posrate	1, 2, 4, 5, 10, 20		Rate in Hz at which MASTERPOS output is required (default = 1 Hz)	Ulong	4	H+8

Dual antenna ALIGN rates (*obsrate* and *posrate*) are limited to the maximum position rate allowed by the receiver model.

## 2.36 DYNAMICS

### *Tunes receiver parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to adjust the receiver dynamics to that of an application. It is used to optimally tune receiver parameters.

The **DYNAMICS** command adjusts the Tracking State transition time out value of the receiver, see *Table 150: Tracking State* on page 706. When the receiver loses the position solution, see *Table 80: Solution Status* on page 432, it attempts to steer the tracking loops for fast reacquisition (5 s time-out by default). The **DYNAMICS** command adjusts this time-out value, effectively increasing the steering time. The three states AIR, LAND or FOOT set the time-out to 5, 10 or 20 seconds respectively.

The **DYNAMICS** command should only be used by advanced users. The default of AUTO should **not** be changed except under very specific conditions.

**Message ID:** 258

**Abbreviated ASCII Syntax:**

```
DYNAMICS settings
```

**Factory Default:**

```
DYNAMICS AUTO
```

**Example:**

```
DYNAMICS FOOT
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	DYNAMICS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	settings	See <i>Table 31: User Dynamics</i> below		Receiver dynamics based on the current environment	Enum	4	H

**Table 31: User Dynamics**

Binary	ASCII	Description
0	AIR	Receiver is in an aircraft or a land vehicle, for example a high speed train, with velocity greater than 110 km/h (30 m/s). This is also the most suitable dynamic for a jittery vehicle at any speed.
1	LAND	Receiver is in a stable land vehicle with velocity less than 110 km/h (30 m/s).
2	FOOT	Receiver is being carried by a person with velocity less than 11 km/h (3 m/s).
3	AUTO	Receiver monitors dynamics and adapts behavior accordingly

Qualifying North American Solar Challenge cars annually weave their way through 1000's of miles between the US and Canada. GNSS keeps them on track through many intersections on secondary highways and gives the Calgary team constant intelligence on the competition's every move. In this case, with average speeds of 46 miles/hour and at times a jittery vehicle, AIR is the most suitable dynamic.

## 2.37 ECHO

### *Sets port echo*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set a port to echo.

**Message ID:** 1247

#### **Abbreviated ASCII Syntax:**

```
ECHO [port] echo
```

#### **Factory Default:**

```
ECHO COM1 OFF
```

```
ECHO COM2 OFF
```

```
ECHO COM3 OFF (not supported on OEM719)
```

```
ECHO COM4 OFF (OEM7600, OEM7700 and OEM7720 only)
```

## 2.38 ECUTOFF

### *Sets satellite elevation cut-off for GPS Satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the elevation cut-off angle for tracked GPS satellites. The receiver does not start automatically searching for a GPS satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the ECUTOFF angle are eliminated from the internal position and clock offset solution computations.

This command permits a negative cut-off angle; it could be used in these situations:

- The antenna is at a high altitude, and thus can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **ECUTOFF** command because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command (see page 140) to set the cut-off angle for any system.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

A low elevation satellite is a satellite the receiver tracks just above the horizon. Generally, a satellite is considered low elevation if it is between 0 and 15 degrees above the horizon.

There is no difference between the data transmitted from a low elevation satellite and that transmitted from a higher elevation satellite. However, differences in the signal path of a low elevation satellite make their use less desirable. Low elevation satellite signals have more error due to the increased amount of atmosphere they must travel through. In addition, signals from low elevation satellites don't fit the assumption that a signal travels in air nearly the same as in a vacuum. As such, using low elevation satellites in the solution results in greater position inaccuracies.

The elevation cut-off angle is specified with **ECUTOFF** to ensure that noisy, low elevation satellite data below the cut-off is not used in computing a position. If post-processing data, it is still best to collect all data (even that below the cut-off angle). Experimenting with different cut-off angles can then be done to provide the best results. In cases where there are not enough satellites visible, a low elevation satellite may actually help in providing a useful solution.

**Message ID:** 50

**Abbreviated ASCII Syntax:**

ECUTOFF angle

**Factory Default:**

---

ECUTOFF 5.0

**ASCII Example:**

ECUTOFF 10.0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.39 ELEVATIONCUTOFF

### *Sets the elevation cut-off angle for tracked satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **ELEVATIONCUTOFF** command is used to set the elevation cut-off angle for tracked satellites. The receiver does not start automatically searching for a satellite until it rises above the cut-off angle (when the satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (refer to the **ASSIGN** command on page 70).

In either case, satellites below the elevation cut-off angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle and can be used in the following situations:

- The antenna is at a high altitude and thus can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **ELEVATIONCUTOFF** command because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

This command combines the following commands into one convenient command: **ECUTOFF**, **GLOECUTOFF**, **GALECUTOFF**, **QZSSECUTOFF**, **SBASECUTOFF**, **BDSECUTOFF** and **NAVICECUTOFF**.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

A low elevation satellite is a satellite the receiver tracks just above the horizon. Generally, a satellite is considered low elevation if it is between 0 and 15 degrees above the horizon.

There is no difference between the data transmitted from a low elevation satellite and that transmitted from a higher elevation satellite. However, differences in the signal path of a low elevation satellite make their use less desirable. Low elevation satellite signals have more error due to the increased amount of atmosphere they must travel through. In addition, signals from low elevation satellites don't fit the assumption that a signal travels in air nearly the same as in a vacuum. As such, using low elevation satellites in the solution results in greater position inaccuracies.

The elevation cut-off angle is specified with the **ELEVATIONCUTOFF** command to ensure that noisy, low elevation satellite data below the cut-off is not used in computing a position. If post-processing data, it is still best to collect all data (even that below the cutoff angle). Experimenting with different cut-off angles can then be done to provide the best results. In cases where there are not enough satellites visible, a low elevation satellite may actually help in providing a useful solution.

**Message ID:** 1735

**Abbreviated ASCII Syntax:**

```
ELEVATIONCUTOFF Constellation Angle [Reserved]
```

**Factory default:**

```
ELEVATIONCUTOFF ALL 5.0 0
```

**ASCII Example:**

```
ELEVATIONCUTOFF GPS 5
```

```
ELEVATIONCUTOFF ALL 5
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ELEVATION CUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Constellation	GPS	0	Sets the cut-off angle for GPS Constellation satellites only.	Enum	4	H
		GLONASS	1	Sets the cut-off angle for GLONASS constellation satellites only.			
		SBAS	2	Sets the cut-off angle for SBAS constellation satellites only.			
		GALILEO	5	Sets the cut-off angle for Galileo constellation satellites only.			
		BEIDOU	6	Sets the cut-off angle for BeiDou constellation satellites only.			
		QZSS	7	Sets the cut-off angle for QZSS constellation satellites only.			
		NAVIC	9	Sets the cut-off angle for NavIC constellation satellites only.			
		ALL	32	Sets the cut-off angle for all satellites regardless of the constellation.			
3	Angle	±90.0 degrees		Elevation cut-off angle relative to the horizon.	Float	4	H+4
4	Reserved	0		Reserved Field (optional)	Ulong	4	H+8

## 2.40 ETHCONFIG

### *Configures Ethernet physical layer*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This command is used to configure the Ethernet physical layer.

**Message ID:** 1245

#### Abbreviated ASCII Syntax:

```
ETHCONFIG interface_name [speed] [duplex] [crossover] [power_mode]
```

#### Factory Default:

```
ETHCONFIG etha auto auto auto powerdown (OEM7 receiver cards)
```

```
ETHCONFIG etha auto auto auto auto (PwrPak7)
```

#### ASCII Example:

```
ETHCONFIG etha 100 full mdix normal
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ETHCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	interface_name	ETHA	2	Name of the Ethernet interface	Enum	4	H
3	speed	AUTO	1	Auto-negotiate speed (default) AUTO is the recommended value for the speed parameter. If setting speed to AUTO, duplex must be set to AUTO at the same time otherwise a "parameter 3 out of range" error occurs.	Enum	4	H+4
		10	2	Force 10BaseT			
		100	3	Force 100BaseT			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	duplex	AUTO	1	Auto-negotiate duplex (default) If setting duplex to AUTO, speed must be set to AUTO at the same time otherwise a "parameter 3 out of range" error occurs.	Enum	4	H+8
		HALF	2	Force half duplex			
		FULL	3	Force full duplex			
5	crossover	AUTO	1	Auto-detect crossover (default)	Enum	4	H+12
		MDI	2	Force MDI (straight through)			
		MDIX	3	Force MDIX (crossover)			
6	power_mode	AUTO	1	Energy detect mode (default for PwrPak7)	Enum	4	H+16
		POWERDOWN	2	Soft power down mode (default for OEM7 receiver cards)			
		NORMAL	3	Normal mode			

The crossover parameter is ignored on OEM7 receivers, as the hardware automatically detects the cable connection and configures the interface for proper communication. For backwards compatibility, the crossover options are still accepted, but have no functional impact.

## 2.41 EVENTINCONTROL

### Controls Event-In input triggers

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command controls up to four Event-In input triggers. Each input can be used as an event strobe.

When used as an event strobe, an accurate GPS time or position is applied to the rising or falling edge of the input event pulse (refer to the **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log on page 603, **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** log on page 600 or **MARK1PVA**, **MARK2PVA**, **MARK3PVA** and **MARK4PVA** log on page 1002). Each input strobe is usually associated with a separate device, therefore different solution output lever arm offsets can be applied to each strobe. When used as an Event Input Trigger, it is possible to overwhelm the receiver with a very high rate of input events that impacts the performance of the receiver. For this reason, the receiver internally throttles the rate at which it responds to input events. The limit is 200 Hz.

**Message ID:** 1637

#### Abbreviated ASCII Syntax:

```
EVENTINCONTROL mark switch [polarity] [t_bias] [t_guard]
```

#### ASCII Example:

```
EVENTINCONTROL MARK1 ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	EVENTIN CONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mark	MARK1	0	Choose which Event-In Mark to change. This value must be specified.  <b>Note:</b> MARK3 and MARK4 are available only on OEM7600, OEM7700 and OEM7720 receivers.	Enum	4	H
		MARK2	1				
		MARK3	2				
		MARK4	3				
3	switch	DISABLE	0	Disables Event Input	Enum	4	H+4
		EVENT	1	Enables Event Input			
		ENABLE	3	A synonym for the EVENT option (for compatibility with previous releases)			
4	polarity	NEGATIVE	0	Negative polarity (default)	Enum	4	H+8
		POSITIVE	1	Positive polarity			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	t_bias	default: 0 minimum: -999,999,999 maximum: 999,999,999		A constant time bias in nanoseconds can be applied to each event pulse. Typically this is used to account for a transmission delay.	Long	4	H+12
6	t_guard	default: 4 minimum: 2 maximum: 3,599,999		The time guard specifies the minimum number of milliseconds between pulses. This is used to coarsely filter the input pulses.	Ulong	4	H+16

## 2.42 EVENTOUTCONTROL

### Control Event-Out properties

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command configures up to seven Event-Out output strobes. The event strobes toggle between 3.3 V and 0 V. The pulse consists of two periods: one active period followed by a not active period. The start of the active period is synchronized with the top of the GNSS time second and the signal polarity determines whether the active level is 3.3 V or 0 V. The not active period immediately follows the active period and has the alternate voltage.

The outputs that are available vary according to the platform.

A 100 MHz clock is used internally to create these output signals. As a result, all period values are limited to 10 ns steps.

The EVENTOUT outputs cannot synchronize with GPS time until the receiver reaches FINESTEERING time status. As the receiver transitions to GPS time, there may be additional, unexpected pulses on the EVENTOUT signals.

**Message ID:** 1636

#### Abbreviated ASCII Syntax:

```
EVENTOUTCONTROL mark switch [polarity] [active_period] [non_active_period]
```

#### ASCII Example:

```
EVENTOUTCONTROL MARK3 ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	EVENTOUT CONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mark	MARK1	0	Choose which Event-Out Mark to change. This value must be specified.  <b>Note:</b> On OEM719 and OEM729 receivers, only MARK1 is available.  <b>Note:</b> On OEM7600, OEM7700 and OEM7720 receivers, only MARK1 through MARK4 are available.	Enum	4	H
		MARK2	1				
		MARK3	2				
		MARK4	3				
		MARK5	4				
		MARK6	5				
		MARK7	6				

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	switch	DISABLE	0	Disables the Event output	Enum	4	H+4
		ENABLE	1	Enables the Event output			
4	polarity	NEGATIVE	0	Negative polarity (active = 0V) (default)	Enum	4	H+8
		POSITIVE	1	Positive polarity (active = 3.3V)			
5	active_period	default: 500,000,000 minimum: 10 maximum: 999,999,990		Active period of the Event Out signal in nanoseconds. 10 ns steps must be used. <b>Note:</b> If the value entered is not a multiple of 10, it will be rounded down to the nearest 10 ns.	Ulong	4	H+12
6	non_active_period	default: 500,000,000 minimum: 10 maximum: 999,999,990		Non-active period of the Event Out signal in nanoseconds. 10 ns steps must be used. <b>Note:</b> If the value entered is not a multiple of 10, it will be rounded down to the nearest 10 ns.	Ulong	4	H+16

The sum of the active period and inactive period should total 1,000,000,000 ns. If the total exceeds one full second, the active period duration will be as given and the inactive period will be the remainder of the second.

Alternately, the sum of the active and inactive periods may be less than 1,000,000,000 ns, but should divide evenly into 1,000,000,000 ns. For example, if the active period is 150,000,000 and the inactive period is 50,000,000, the sum of the periods is 200,000,000 ns which divides evenly into one full second.

If the sum is less than one full second and not an even multiple, the last active or inactive period is stretched or truncated to equal one full second.

A 100 MHz clock is used internally to create these output signals. As a result, all period values are limited to 10 ns steps.

## 2.43 EXTERNALCLOCK

### Sets external clock parameters

**Platform: OEM729**

The **EXTERNALCLOCK** command is used to enable the OEM7 card to operate with an optional external oscillator. You are able to optimally adjust the clock model parameters of these receivers for various types of external clocks.

1. This command affects the interpretation of the CLOCKMODEL log.
2. If the **EXTERNALCLOCK** command is enabled and set for an external clock (TCXO, OCXO, RUBIDIUM, CESIUM or USER) and the **CLOCKADJUST** command (see page 103) is ENABLED, then the clock steering process takes over the VARF output pins and may conflict with a previously entered **EVENTOUTCONTROL** command (see page 146). If clocksteering is not used with the external oscillator, the clocksteering process must be disabled by using the **CLOCKADJUST disable** command.
3. When using the **EXTERNALCLOCK** command and **CLOCKADJUST** command (see page 103) together, issue the **EXTERNALCLOCK** command first to avoid losing satellites.

There are three steps involved in using an external oscillator:

1. Follow the procedure outlined in the [OEM7 Installation and Operation User Manual](#) to connect an external oscillator to the OEM7.
2. Using the **EXTERNALCLOCK** command, select a standard oscillator and its operating frequency.
3. Using the **CLOCKADJUST** command (see page 103), disable the clocksteering process if external clocksteering is not used.

An unsteered oscillator can be approximated by a three-state clock model, with two states representing the range bias and range bias rate, and a third state assumed to be a Gauss-Markov (GM) process representing the range bias error generated from satellite clock dither. The third state is included because the Kalman filter assumes an (unmodeled) white input error. The significant correlated errors produced by satellite clock dither are obviously not white and the Markov process is an attempt to handle this kind of short term variation.

The internal units of the new clock model's three states (offset, drift and GM state) are meters, meters per second and meters. When scaled to time units for the output log, these become seconds, seconds per second and seconds, respectively.

The user has control over 3 process noise elements of the linear portion of the clock model. These are the  $h_0$ ,  $h_{-1}$  and  $h_{-2}$  elements of the power law spectral density model used to describe the frequency noise characteristics of oscillators:

$$S_y(f) = \frac{h_{-2}}{f^2} + \frac{h_{-1}}{f} + h_0 + h_1 f + h_2 f^2$$

where  $f$  is the sampling frequency and  $S_y(f)$  is the clock's power spectrum. Typically only  $h_0$ ,  $h_{-1}$ , and  $h_{-2}$  affect the clock's Allan variance and the clock model's process noise elements.

Before using an optional external oscillator, several clock model parameters must be set. There are default settings for a Voltage-Controlled Temperature-Compensated Crystal Oscillator (VCTCXO), Ovenized Crystal Oscillator (OCXO), Rubidium and Cesium standard, which are given in *Table 33: Clock Type* on the next page. You may alternatively choose to supply customized settings.

The **EXTERNALCLOCK** command configures whether the receiver uses its own internal temperature-compensated crystal oscillator or that of an external oscillator as a frequency reference. It also sets which clock model is used for an external oscillator.

To force the OEM7 to use the internal oscillator, use the **EXTERNALCLOCK disable** command and physically disconnect the external oscillator input. Do not use the EXTERNALCLOCK OCXO, CESIUM, RUBIDIUM or USER parameters if there is no external oscillator connected to the OEM7.

**Message ID: 230****Abbreviated ASCII Syntax:**

```
EXTERNALCLOCK clocktype [freq] [h0 [h-1 [h-2]]]
```

**Factory Default:**

```
EXTERNALCLOCK disable
```

**ASCII Examples:**

```
EXTERNALCLOCK USER 10MHZ 1.0167e-23 6.87621e-25 8.1762e-26
```

```
EXTERNALCLOCK TCXO 5MHZ
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	EXTERNALCLOCK header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	clocktype	See <i>Table 33: Clock Type</i> below		Clock type	Enum	4	H
3	freq	5MHZ	1	Optional frequency. If a value is not specified, the default is 5 MHz	Enum	4	H+4
		10MHZ	2				
4	h <sub>0</sub>	1.0 e-35 to 1.0 e-18		Optional timing standards. These fields are only valid when the USER clocktype is selected. Do not use h values with VCTCXO, OCXO, CESIUM or RUBIDIUM clock types. The h values for these options are fixed, see <i>Table 34: Pre-Defined Values for Oscillators</i> on the next page (default=0.0)	Double	8	H+8
5	h <sub>-1</sub>	1.0 e-35 to 1.0 e-18			Double	8	H+16
6	h <sub>-2</sub>	1.0 e-35 to 1.0 e-18			Double	8	H+24

**Table 33: Clock Type**

ASCII	Binary	Description
DISABLE	0	Turns the external clock input off, reverts back to the on-board VCTCXO. When used in a binary command, use the parameter defaults (i.e. freq=1, h <sub>0</sub> =0, h <sub>-1</sub> =0, h <sub>-2</sub> =0).

ASCII	Binary	Description
TCXO	1	Sets the predefined values for a VCTCXO
OCXO	2	Sets the predefined values for an OCXO
RUBIDIUM	3	Sets the predefined values for a rubidium oscillator
CESIUM	4	Sets the predefined values for a cesium oscillator
USER	5	Defines custom process noise elements

**Table 34: Pre-Defined Values for Oscillators**

Clock Type	$h_0$	$h_{-1}$	$h_{-2}$
VCTCXO	1.0 e-21	1.0 e-20	1.0 e-20
OCXO	2.51 e-26	2.51 e-23	2.51 e-22
Rubidium	1.0 e-23	1.0 e-22	1.3 e-26
Cesium	2.0 e-20	7.0 e-23	4.0 e-29

## 2.44 FILEAUTOTRANSFER

*Enables/Disables automatic file transfer*

Platform: PwrPak7

PwrPak7M variants do not support this command.

Use this command to configure the automatic transfer function from internal memory to an external USB stick. If the mode is set to COPY or MOVE, all log files, except the file currently being logged to, will be automatically transferred to a USB stick when the USB stick is inserted.

This command will transfer all recorded log files to the USB stick provided the USB stick has enough free space to hold all the data. **Files too large to fit in the remaining space on the USB stick are skipped.**

The command must be issued before the USB stick is inserted. If the command is not issued first, the USB stick must be removed and reinserted to trigger the auto transfer.

The status of the transfer can be viewed by logging the **FILETRANSFERSTATUS** log (see page 474).

A transfer in progress can be canceled by issuing the **FILETRANSFER CANCEL** command.

The settings for this command can be saved using the **SAVECONFIG** command (see page 302).

**Message ID: 2135**

**Abbreviated ASCII Syntax:**

```
FILEAUTOTRANSFER [FileAutoTransferMode]
```

**ASCII Example:**

```
FILEAUTOTRANSFER COPY
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	FILEAUTOTRANSFER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	FileAutoTransferMode	1	OFF	Automatic copy/move is disabled (default)	Ulong	4	H
		2	COPY	Automatically copies all files			
		3	MOVE	Automatically copies all files and then deletes them from internal memory after a successful copy			

For the fastest transfer of files to an external memory stick, it is recommended that logging to a file be stopped.

## 2.45 FILECONFIG

### *Open or close a log file*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7

PwrPak7M variants do not support this command.

To record logs, log requests are sent to the FILE port. Before the logs sent to the FILE port can be saved in a file, the file must be opened using the **FILECONFIG** command.

When configured to be open, a log file will be opened when the active file media is ready and has sufficient space. Once a log file is opened, any logs requested for the FILE port are recorded to the file.

Use the **FILESTATUS** log (see page 468) to determine the state of the log file.

The file media is separately configured:

- On receiver cards, this is always USBSTICK, which is the only media available.
- On the PwrPak7, the active file media is configured using the **FILEMEDIACONFIG** command on page 155.

When a file is opened, the file name is automatically generated based on the following format:

<PSN>\_<INDEX>.LOG

where:

- <PSN> is the PSN of the receiver
- <INDEX> is a number from 1 to 511.

The lowest number that produces an unused file name is selected. If there is no such number available, the **FILESTATUS** log (see page 468) will report an error.

The number is not zero-padded (i.e. the sequence is as follows: 1,2, ... ,9,10,11,12, ... ,99,100, ... , 510,511).

When a file is closed and the receiver has a valid time, the file is renamed based on the following format:

<PSN>\_<UTC Date>\_<UTC Time>.LOG

where:

- <PSN> is the PSN of the receiver
- <UTC\_Date> is the UTC date in the format YYYY-MM-DD
- <UTC\_Time> is the UTC time in the format HH-MM-SS

Example file name: NOV12001200A\_2017-01-10\_12-14-34.LOG

When a file is closed, but the receiver does not have a valid time, the file is left with its automatically generated name.

#### **Other Notes:**

- The FILE port represents the internal logging to flash memory. It has a NOVATEL Interface Mode - output only, no input is possible.
- Only logs that are published after the log file is open are recorded.

- Only one log file can be open at a time.
- Logs requested to the FILE port are still produced even if the log file is closed; however the logs are not recorded. (This is similar to requesting logs to COM4 when there's no cable on COM4.) If a new log file is opened, recording of the previously requested logs continues with the new file.
- When a file is closed, the log file is renamed to the format <PSN>\_<UTC Date>\_<UTC Time>.LOG, where the UTC time is the time when the file is closed. If the time is not available, the file is not renamed. If there is already a file with the intended name, the file is not renamed.
- After closing a file, the file system will be flushed to ensure that all data is written to the media.
- A disk is considered "full" when it has <= 10 MB of free space. This buffer is left in place to allow the system time and space to open up a new file if required.

**Message ID: 2116****Abbreviated ASCII Syntax:**

```
FILECONFIG FileOperation
```

**Factory Default:**

```
FILECONFIG CLOSE
```

**Example:**

```
FILECONFIG OPEN
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FILECONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	FileOperation	OPEN	1	Open (create) a new logging file	Enum	4	H
		CLOSE	2	Close the logging file			

## 2.46 FILEDELETE

**Deletes files from the currently selected mass storage device**

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7

PwrPak7M variants do not support this command.

Use this command to delete a single file, or use the wild card symbol (\*) to delete all files, from the logging directory of the currently selected file media. This command will not delete a file if it is currently open for logging. Use the **FILESTATUS** log (see page 468) to determine the state of the log file.

The wild card symbol deletes all files in the directory. It cannot be used to delete a subset of the files in the directory. For example, the command **FILEDELETE \*.LOG** will be rejected by the receiver.

The file media is separately configured:

- On receiver cards, the file media is always USBSTICK, which is the only media available.
- On enclosure products, the active file media is configured using a product-specific command, such as **FILEMEDIACONFIG** command (see page 155).

The list of files stored on the currently selected file media can be retrieved using the **FILELIST** log on page 466.

**Message ID: 2190**

**Abbreviated ASCII Syntax:**

```
FILEDELETE FileName
```

**Example:**

```
FILEDELETE NMNE17130016A_2017-12-11_18-17-06.LOG – Delete the file NMNE17130016A_2017-12-11_18-17-06.LOG
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILEDELETE header	Command header. See <i>Messages</i> on page 30 for more information.		H	0
2	FileName	Name of file to delete, or the wild card symbol (*)	String (Max 128)	variable <sup>1</sup>	H

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.47 FILEMEDIACONFIG

### *Specify the file media*

Platform: PwrPak7

PwrPak7M variants do not support this command.

Use this command to specify which storage media is used for File operations.

To determine what storage device is currently being used for File operations, log this command. For example:

```
LOG FILEMEDIACONFIG
```

On OEM7 receiver cards, the file media is always USBSTICK, which is the only media available. On PwrPak7 products, the active file media is configured using the **FILEMEDIACONFIG** command.

**Message ID: 2117**

#### Abbreviated ASCII Syntax:

```
FILEMEDIACONFIG MassStorage
```

#### ASCII Example:

```
FILEMEDIACONFIG INTERNAL_FLASH    – Use internal flash as the media
```

```
FILEMEDIACONFIG USBSTICK          – Use a USB stick as the media
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FILEMEDIACONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MassStorageDevice	1	USBSTICK	Use a USB stick as the mass storage device	Enum	4	H
		2	INTERNAL_FLASH	Use Internal storage as the mass storage device			

## 2.48 FILEROTATECONFIG

### *Set the maximum size and duration of a log file*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7

PwrPak7M variants do not support this command.

Use this command to configure the maximum size and duration for a log file. This command also configures the action taken when the log file media is full.

A file rotation is when a new file is opened, the currently opened file is closed and logging on the FILE port is rerouted to this new file. There is no data loss during this process and individual logs within the file are not spread between log files.

**Message ID: 2133**

#### Abbreviated ASCII Syntax:

```
FILEROTATECONFIG [MaxFileTime] [MaxFileSize] [DiskFullAction]
```

#### Factory Default:

```
FILEROTATECONFIG 0 4096 STOP
```

#### Example:

```
FILEROTATECONFIG 2 4096 STOP
```

The file is left open for 2 hours or until the file size reaches 4096 MB. When the log file media is full, the file is closed.

```
FILEROTATECONFIG 4 4096 OVERWRITE
```

The file is left open for 4 hours or until the file size reaches 4096 MB. When the log media file is full, the oldest file on the log media file will be deleted.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FILEROTATE CONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MaxFileTime	0 to 24		Maximum number of hours to leave a file open before triggering a file rotation. Set to 0 for no maximum time. Maximum value is 24. Default is 0.	Ushort	2	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	MaxFileSize	1 to 4096		Maximum number of mega bytes (MB) for the file size. A file rotation is triggered when the file is within 1 MB of this size. Maximum value is 4096 MB Default is 4096 MB (4 GB).	Ushort	2	H+2
4	DiskFullAction	See <i>Table 35: Disk Full Action</i> below		Action to take when the log file media is full.	Enum	4	H+4

Table 35: Disk Full Action

Binary	ASCII	Description
0	STOP	Stops logging when the file media has 1 MB of free space or less or the file media has reached 1500 files. Default is STOP.
1	OVERWRITE	Deletes the oldest log file when the file media has 10 MB of free space or less or the file media has exceeded 1500 files. To be selected for deletion a file must satisfy these requirements: <ul style="list-style-type: none"> <li>The file must use the <b>FILECONFIG</b> command (see page 152) file name format.</li> <li>The &lt;PSN&gt; value must match the current receiver.</li> </ul> File age is determined using the <b>FILECONFIG</b> command (see page 152) file name format. <ul style="list-style-type: none"> <li>Temporary files (i.e. those with an &lt;INDEX&gt; value) are considered oldest. Such files will be sorted by their &lt;INDEX&gt; value with lower values considered older.</li> <li>Non-temporary files will be sorted by the date reported in the file format.</li> </ul>

## 2.49 FILETRANSFER

### *Copy files from internal memory*

Platform: PwrPak7

PwrPak7M variants do not support this command.

Use this command to copy files from internal memory to a USB stick. This command can also be used to cancel the file transfer in progress.

This command returns a response immediately to show that the copy/move operation started. However, the actual transfer of files will take some time. Use the **FILETRANSFERSTATUS** log (see page 474) to monitor the status of the file transfer.

To view the names of the files in memory, log the **FILELIST** log (see page 466).

**Message ID: 2109**

#### Abbreviated ASCII Syntax:

```
FILETRANSFER FileTransferOperation <FileName>
```

#### ASCII Examples:

```
FILETRANSFER COPY ALL           – Copies all files on internal memory
```

```
FILETRANSFER MOVE BMHR16460033T_2017-3-16_21-18-48.log
```

```
FILETRANSFER CANCEL           – Cancels file transfer operation
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	FILETRANSFER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	FileTransferOperation	1	COPY	Copy the file	Enum	4	H
		2	MOVE	Copy the file and then delete file from internal memory			
		3	CANCEL	Cancels the file transfer currently in progress			
3	FileName			The name of the file to be moved or copied. To move or copy all of the files on internal memory, use ALL.	String	Variable	H+4

When a **FILETRANSFER CANCEL ALL** command is issued, the file currently being transferred, and any pending files, are not transferred to the destination media. Any files already transferred are unaffected.

## 2.50 FIX

### *Constrains to fixed height or position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to fix height or position to the input values. For various applications, fixing these values can assist in improving acquisition times and accuracy of position or corrections. For example, fixing the position is a requirement for differential base stations as it provides the reference position to base the differential corrections from.

1. It is strongly recommended that the FIX POSITION entered be accurate to within a few meters. This level of accuracy can be obtained from a receiver using single point positioning once 5 or 6 satellites are being tracked.
2. FIX POSITION should only be used for base station receivers. Applying FIX POSITION to a rover switches it from RTK mode to a fixed position mode. Applying FIX POSITION to the rover does not speed up ambiguity resolution.
3. Any setting other than FIX POSITION disables output of differential corrections unless the **MOVINGBASESTATION** command (see page 231) is set to ENABLE.
4. You can fix the position of the receiver using latitude, longitude and height in Mean Sea Level (MSL) or ellipsoidal parameters depending on the UNDULATION setting. The factory default for the **UNDULATION** command (see page 369) setting is EGM96, where the height entered in the **FIX** command is set as MSL height. If you change the UNDULATION setting to USER 0, the height entered in the **FIX** command is set as ellipsoidal height (refer to *Table 36: FIX Parameters* on the next page).

Error checking is performed on the entered fixed position by the integrity monitor. Depending on the result of this check, the position can be flagged with the following statuses.

- SOL\_COMPUTED: The entered position has been confirmed by measurement.
- PENDING: Insufficient measurements are available to confirm the entered position.
- INTEGRITY\_WARNING: First level of error when an incorrect position has been entered. The fixed position is off by approximately 25-50 meters.
- INVALID\_FIX: Second level of error when an inaccurate position has been entered. The fixed position is off by a gross amount.

An incorrectly entered fixed position will be flagged either INTEGRITY\_WARNING or INVALID\_FIX. This will stop output of differential corrections or RTK measurements and can affect the clock steering and satellite signal search. Checks on the entered fixed position can be disabled using the **RAIMMODE** command (see page 278).

**Message ID: 44**

**Abbreviated ASCII Syntax:**

```
FIX type [param1 [param2 [param3]]]
```

**Factory Default:**

```
FIX none
```

**ASCII Example:**

```

FIX none
FIX HEIGHT 4.567
FIX position 51.116 -114.038 1065.0

```

In order to maximize the absolute accuracy of RTK rover positions, the base station coordinates must be fixed to their known position using the **FIX POSITION [lat][lon][hgt]** command.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FIX header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	See <i>Table 37: Fix Types</i> on the next page		Fix type	Enum	4	H
3	param1	See <i>Table 36: FIX Parameters</i> below		Parameter 1	Double	8	H + 4
4	param2			Parameter 2	Double	8	H + 12
5	param3			Parameter 3	Double	8	H + 20

**Table 36: FIX Parameters**

ASCII Type Name	Parameter 1	Parameter 2	Parameter 3
AUTO	Not used	Not used	Not used
HEIGHT	Default MSL height <sup>1</sup> (-1000 to 20000000 m)	Not used	Not used
NONE	Not used	Not used	Not used
POSITION	Lat (-90 to 90 degrees) where a '-' sign denotes south and a '+' sign denotes north	Lon (-360 to 360 degrees) where a '-' sign denotes west and a '+' sign denotes east	Default MSL height <sup>1</sup> (-1000 to 20000000 m)

For a discussion on height, refer to *An Introduction to GNSS* available on our website at [nova-tel.com/an-introduction-to-gnss](http://nova-tel.com/an-introduction-to-gnss).

<sup>1</sup>See also Note #4 above.

Table 37: Fix Types

ASCII Name	Binary Value	Description
NONE	0	Unfix. Clears any previous FIX commands
AUTO	1	Configures the receiver to fix the height at the last calculated value if the number of satellites available is insufficient for a 3-D solution. This provides a 2-D solution. Height calculation resumes when the number of satellites available allows a 3-D solution
HEIGHT	2	<p>Configures the receiver in 2-D mode with its height constrained to a given value. This command is used mainly in marine applications where height in relation to mean sea level may be considered to be approximately constant. The height entered using this command is referenced to the mean sea level, see the <b>BESTPOS</b> log on page 429 (is in meters). The receiver is capable of receiving and applying differential corrections from a base station while fix height is in effect. The fix height command overrides any previous <b>FIX HEIGHT</b> or <b>FIX POSITION</b> command.</p> <p><b>Note:</b> This command only affects pseudorange corrections and solutions.</p>
POSITION	3	<p>Configures the receiver with its position fixed. This command is used when it is necessary to generate differential corrections.</p> <p>For both pseudorange and differential corrections, this command must be properly initialized before the receiver can operate as a GNSS base station. Once initialized, the receiver computes differential corrections for each satellite being tracked. The computed differential corrections can then be output to rover stations using the RTCMV3 differential corrections data log format. See the <a href="#">OEM7 Installation and Operation User Manual</a> for information about using the receiver for differential applications.</p> <p>The values entered into the fix position command should reflect the precise position of the base station antenna phase center. Any errors in the fix position coordinates directly bias the corrections calculated by the base receiver.</p> <p>The receiver performs all internal computations based on WGS84 and the <b>DATUM</b> command (see page 119) is defaulted as such. The datum in which you choose to operate (by changing the <b>DATUM</b> command (see page 119)) is internally converted to and from WGS84. Therefore, all differential corrections are based on WGS84, regardless of your operating datum.</p> <p>The <b>FIX POSITION</b> command overrides any previous <b>FIX HEIGHT</b> or <b>FIX POSITION</b> command settings.</p>

## 2.51 FORCEGALE6CODE

***Force receiver to track Galileo E6C or E6B signal***

**Platform:** OEM719, OEM729, OEM7700, PwrPak7

Use this command to force Galileo E6 channels to track E6B or E6C.

**Message ID:** 2222

**Abbreviated ASCII Syntax:**

```
FORCEGALE6CODE E6codetype
```

**Factory Default:**

```
FORCEGALE6CODE E6C
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FORCEGALE6CODE	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	E6codetype	E6B	0	Galileo E6 code type (default = E6C)	Enum	4	H
		E6C	1				

## 2.52 FORCEGL2CODE

### *Forces receiver to track GLONASS satellite L2 P or L2 C/A code*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to force the receiver to track GLONASS satellite L2 P-code or L2 C/A code. This command has no effect if the channel configuration contains both GLONASS L2 P and L2 C/A channels.

**Message ID:** 1217

**Abbreviated ASCII Syntax:**

```
FORCEGL2CODE L2type
```

**Factory Default:**

```
FORCEGL2CODE default
```

**ASCII Example:**

```
FORCEGL2CODE p
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FORCEGLO L2CODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	L2type	See <i>Table 38: GLONASS L2 Code Type</i> below		GLONASS L2 code type	Enum	4	H

**Table 38: GLONASS L2 Code Type**

Binary	ASCII	Description
1	P	L2 P-code or L2 Precise code
2	C	L2 C/A code or L2 Coarse/Acquisition code
3	DEFAULT	Set to channel default

The following table lists which L2 signal is tracked based on the channel configuration and the setting used for the L2type parameter.

**Table 39: Signals Tracked – Channel Configuration and L2type Option**

Channel Configuration for L2 Signal	L2type Setting		
	P	C	DEFAULT
L2	P	C	P
L2C	P	C	C
L2PL2C	Both	Both	Both

## 2.53 FORCEGPSL2CODE

### *Forces receiver to track GPS satellite L2 P or L2C code*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to force the receiver to track GPS L2 P-code or L2C code. AUTO tells the receiver to use L2C code type if available and L2 P-code if L2C code is not available. This command has no effect if the channel configuration contains both GPS L2 P and L2 C channels.

**Message ID:** 796

#### Abbreviated ASCII Syntax:

```
FORCEGPSL2CODE L2type
```

#### Factory Default:

```
FORCEGPSL2CODE default
```

#### ASCII Example:

```
FORCEGPSL2CODE p
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FORCEGPS L2CODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	L2type	See <i>Table 40: GPS L2 Code Type</i> below		GPS L2 code type	Enum	4	H

**Table 40: GPS L2 Code Type**

Binary	ASCII	Description
0	AUTO	Receiver uses the L2C if available and L2 P otherwise. An exception is when the receiver is doing RTK positioning. In that case, AUTO changes the L2 code type being tracked to match the L2 code type found in the base station corrections, which ensures the greatest number of satellites are used in the solution.
1	P	L2 P-code or L2 Precise code
2	C	L2C code or L2 Civilian code
3	DEFAULT	Set to channel default

The following table lists which L2 signal is tracked based on the channel configuration and the setting used for the L2type parameter.

**Table 41: Signals Tracked – Channel Configuration and L2type Option**

Channel Configuration for L2 Signal	L2type Setting			
	Auto	P	C	DEFAULT
L2	C if available, P(Y) otherwise	P(Y)	C	P(Y)
L2C	C if available, P(Y) otherwise	P(Y)	C	C
L2P	C if available, P(Y) otherwise	P(Y)	C	P(Y)
L2AUTO	C if available, P(Y) otherwise	P(Y)	C	C if available, P(Y) otherwise
L2PL2C	Both	Both	Both	Both

## 2.54 FREQUENCYOUT

### *Sets output pulse train available on VARF*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to set the output pulse train available on the Variable Frequency (VARF) or EVENT\_OUT1 pin. The output waveform is coherent with the 1PPS output, see the usage note and *Figure 4: Pulse Width and 1PPS Coherency* on the next page.

The **FREQUENCYOUT** command is obsolete. Use the **EVENTOUTCONTROL** command (see page 146) to set the output pulse train on the VARF and EVENT\_OUT pins.

If the **CLOCKADJUST** command (see page 103) is ENABLED and the receiver is configured to use an external reference frequency (set in the **EXTERNALCLOCK** command (see page 148) for an external clock - TCXO, OCXO, RUBIDIUM, CESIUM, or USER), then the clock steering process takes over the VARF output pins and may conflict with a previously entered **FREQUENCYOUT** command.

*Figure 4: Pulse Width and 1PPS Coherency* on the next page shows how the chosen pulse width is frequency locked but not necessarily phase locked when using ENABLE option. To synchronize the phase, use ENABLESYNC option.

The EVENTOUT outputs cannot synchronize with GPS time until the receiver reaches FINESTEERING time status. As the receiver transitions to GPS time, there may be additional, unexpected pulses on the EVENTOUT signals.

**Message ID: 232**

#### **Abbreviated ASCII Syntax:**

```
FREQUENCYOUT [switch] [pulsewidth] [period]
```

#### **Factory Default:**

```
FREQUENCYOUT disable
```

#### **ASCII Example:**

```
FREQUENCYOUT ENABLE 50000 100000
```

This example generates a 50% duty cycle 1 kHz square wave.

Signal integrity will begin to degrade when generating a clock frequency greater than 10 MHz. It is not recommended to generate a clock frequency greater than 20 MHz.

Figure 4: Pulse Width and 1PPS Coherency

When using ENABLE option, the VARF and 1PPS are not necessarily in phase as described in *Figure 4: Pulse Width and 1PPS Coherency* above. To align the phase of the VARF with the 1PPS, use the ENABLESYNC option and the VARF phase will be synchronized to the leading edge of the 1PPS pulse. Note that if the VARF and 1PPS frequencies are not even multiples of each other, this may cause the VARF to have a shorter cycle pulse prior to each 1PPS pulse. 1PPS is not affected.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FREQUENCYOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disable causes the output to be fixed low. (if NONE specified, defaults to DISABLE)	Enum	4	H
		ENABLE	1	Enables customized frequency output.			
		ENABLE SYNC	2	Enables customized frequency output synchronized to PPS.			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	pulsewidth	(0 to 1073741823)		Number of 10 ns steps for which the output is high. Duty cycle = pulsewidth / period. If pulsewidth is greater than or equal to the period, the output is a high DC signal. If pulsewidth is 1/2 the period, then the output is a square wave. (default = 0)	Ulong	4	H+4
4	period	(0 to 1073741823)		Signal period in 10 ns steps. Frequency Output = 100,000,000 / Period (default = 0)	Ulong	4	H+8

## 2.55 FRESET

### *Clears selected data from NVM and reset*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to clear data which is stored in non-volatile memory. Such data includes the almanac, ephemeris, and any user specific configurations. The commands, ephemeris, almanac, and L-Band related data, excluding the subscription information, can be cleared by using the STANDARD target. The receiver is forced to reset.

**FRESET STANDARD** (which is also the default) causes most commands, ephemeris, GNSS and almanac data previously saved to NVM to be erased.

The **FRESET STANDARD** command will erase all user settings. You should know your configuration (by requesting the **RXCONFIG** log on page 775) and be able to reconfigure the receiver before you send the **FRESET** command.

**Message ID:** 20

**Abbreviated ASCII Syntax:**

```
FRESET [target]
```

**Input Example:**

```
FRESET COMMAND
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	FRESET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	target	See <i>Table 42: FRESET Target</i> on the next page		What data is to be reset by the receiver (default = STANDARD)	Enum	4	H

If you are receiving no data or random data from your receiver, try the following before contacting NovAtel:

- Verify that the receiver is tracking satellites by logging the **TRACKSTAT** log (see page 858) and checking that the receiver is tracking at least four satellites.
- Check the integrity and connectivity of power, antenna and data cables
- Verify the baud rate settings of the receiver and terminal device (your PC, data logger or laptop)
- Switch COM ports
- Issue the **FRESET** command.

Table 42: FRESET Target

Binary	ASCII	Description
0	STANDARD	Resets commands (except <b>CLOCKCALIBRATION</b> and <b>MODEL</b> ). Resets the stored ephemeris and almanac from all satellite systems. Resets all L-Band related data except for the subscription information. Does not reset the Ethernet settings or stored Profile configurations. (default)
1	COMMAND	Resets the stored commands (saved configuration)
2	GPSALMANAC	Resets the stored GPS almanac
3	GPSEPHEM	Resets the stored GPS ephemeris
4	GLOEPHEM	Resets the stored GLONASS ephemeris
5	MODEL	Resets the currently selected model
10	USERDATA	Resets the user data saved using the <b>NVMUSERDATA</b> command (see page 245)
11	CLKCALIBRATION	Resets the parameters entered using the <b>CLOCKCALIBRATE</b> command (see page 105)
20	SBASALMANAC	Resets the stored SBAS almanac
21	LAST_POSITION	Resets the position using the last stored position
31	GLOALMANAC	Resets the stored GLONASS almanac
39	GALFNAV_EPH	Resets the stored GALFNAV ephemeris
40	GALINAV_EPH	Resets the stored GALINAV ephemeris
45	GALFNAV_ALM	Resets the stored GALFNAV almanac
46	GALINAV_ALM	Resets the stored GALINAV almanac
52	PROFILEINFO	Resets the stored profile configurations
54	QZSSALMANAC	Resets the QZSS almanac
55	QZSSEPHEMERIS	Resets the QZSS ephemeris
57	BDSALMANAC	Resets the BeiDou almanac
58	BDSEPHEMERIS	Resets the BeiDou ephemeris
60	USER_ACCOUNTS	Resets the admin password to the default (the receiver PSN)
64	ETHERNET	Resets the stored Ethernet settings
85	SRTK_SUBSCRIPTIONS	Resets the Secure RTK Subscription data stored on the rover receiver

Binary	ASCII	Description
87	NAVICEPHEMERIS	Resets the NavIC ephemeris
88	NAVICALMANAC	Resets the NavIC almanac
93	USER_DATUM	Resets the user datums (see the <b>GEODETICDATUM</b> command on page 179)
94	USER_DATUM_ TRANSFORMATION	Resets the user datums transformations (see the <b>DATUMTRANSFORMATION</b> command on page 121)

## 2.56 GALECUTOFF

### *Sets elevation cut-off angle for Galileo satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the elevation cut-off angle for tracked Galileo satellites. The receiver does not start automatically searching for a satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they were manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the GALECUTOFF angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle and can be used in the following situations:

- The antenna is at a high altitude and thus look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **GALECUTOFF** because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command (see page 140) to set the cut-off angle for any system.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

**Message ID:** 1114

**Abbreviated ASCII Syntax:**

```
GALECUTOFF angle
```

**Factory Default:**

```
GALECUTOFF 5.0
```

**ASCII Example:**

```
GALECUTOFF 10.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GALECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.57 GENERATEALIGNCORRECTIONS

### Configure ALIGN Master

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to configure the ALIGN Master and starts sending out ALIGN corrections through the specified port. This command is like sending the following commands to the Master, assuming the use of a serial port and default ALIGN corrections:

```
unlogall [port]
fix none
movingbasestation enable
interfacemode [port] novatel rtca
serialconfig [port] [baud] N 8 1 N ON
log [port] rtcaobs3 ontime [rate = 1/ obsregrate]
log [port] rtcarefext ontime [rate = 1/ refextregrate]
```

**Message ID:** 1349

#### Abbreviated ASCII Syntax:

```
GENERATEALIGNCORRECTIONS port [baud] [obsregrate] [refextregrate]
[interfacemode]
```

#### ASCII Example:

```
GENERATEALIGNCORRECTIONS COM2 230400 10 10
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GENERATEALIGN CORRECTIONS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 32: Communications Port Identifiers</i> on page 136		Port identifier (default = THISPORT)	Enum	4	H
3	baud	9600, 19200, 38400, 57600, 115200, 230400 or 460800		Communication baud rate (bps) (default = 9600)	Ulong	4	H+4
4	obsregrate	1, 2, 4, 5, 10, 20, 50 or 100		RTCAOBS3 data rate in Hz (default = 1)	Ulong	4	H+8
5	refextregrate	0, 1, 2, 4, 5, 10, 20, 50 or 100		RTCAREFEXT data rate in Hz (default = 1)	Ulong	4	H+12
6	interfacemode	RTCA	3	Correction interface mode (default = RTCA)	Enum	4	H+16
		NOVATELX	35				

## 2.58 GENERATEDIFFCORRECTIONS

*Sends a preconfigured set of differential corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to configure the receiver to send a preconfigured set of differential pseudorange corrections.

**Message ID:** 1296

**Abbreviated ASCII Syntax:**

```
GENERATEDIFFCORRECTIONS mode port
```

**ASCII Example:**

```
GENERATEDIFFCORRECTIONS rtcn com2
```

Preconfigured set of differential corrections sent when RTCM:

```
RTCM1 ontime 1
RTCM31 ontime 1
RTCM3 ontime 10
```

Preconfigured set of differential corrections sent when RTCA:

```
RTCA1 ontime 1
RTCAREF ontime 10
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GENERATEDIFFCORRECTIONS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	RTCM	2	Serial port interface mode identifier. See <i>Table 44: Serial Port Interface Modes</i> on page 191	Enum	4	H
		RTCA	3				
3	port	See <i>Table 63: COM Port Identifiers</i> on page 318		Port to configure	Enum	4	H+4

## 2.59 GENERATERTKCORRECTIONS

*Sends a preconfigured set of RTK corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to configure the receiver to send a preconfigured set of RTK (carrier phase) corrections.

**Message ID:** 1260

**Abbreviated ASCII Syntax:**

```
GENERATERTKCORRECTIONS mode port
```

**ASCII Example:**

```
GENERATERTKCORRECTIONS rtcmv3 com2
```

Preconfigured set of differential corrections sent when RTCM:

```
RTCM1819 ontime 1
RTCM3 ontime 10
RTCM22 ontime 10
RTCM23 ontime 60
RTCM24 ontime 60
```

Preconfigured set of differential corrections sent when RTCMV3:

```
RTCM1004 ontime 1
RTCM1012 ontime 1
RTCM1006 ontime 10
RTCM1008 ontime 10
RTCM1033 ontime 10
```

Preconfigured set of differential corrections sent when RTCA:

```
RTCAOBS2 ontime 1
RTCAREF ontime 10
```

Preconfigured set of differential corrections sent when CMR:

```
CMROBS ontime 1
CMRGLOBS ontime 1
CMRREF ontime 10
```

Preconfigured set of differential corrections sent when NOVATELX:

```
NOVATELXOBS ontime 1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GENERATERTK CORRECTIONS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	mode	RTCM	2	Serial port interface mode identifier. For more information, see <i>Table 44: Serial Port Interface Modes</i> on page 191	Enum	4	H
		RTCA	3				
		CMR	4				
		MSM	5				
		MSM12	6				
		MSM3	7				
		MSM4	8				
		MSM5	9				
		MSM6	10				
		MSM7	11				
		RTCMV3	14				
		NOVATELX	35				
3	port	See <i>Table 63: COM Port Identifiers</i> on page 318		Port to configure	Enum	4	H+4

For information about the RTCM, RTCA and CMR messages, refer to the official standards document for those messages.

## 2.60 GEODETICDATUM

### *Set user-defined datum parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to add or remove user-defined datums. These are used by the **OUTPUTDATUM** command (see page 246) to select an entry from the **DATUMTRANSFORMATIONS** log (see page 461). They also define the parameters to convert between geodetic and Cartesian coordinates.

The **OUTPUTDATUM** command (see page 246) must be sent for any user-defined datums to be output.

The receiver firmware includes a default set of datums. These default datums cannot be deleted, but can be overwritten with user-defined parameters. A default datum that has been overwritten can be reverted to the default parameters by deleting the datum. User-defined datums will persist a factory reset; all user-defined datums can be removed by sending **FRESET USER\_DATUM** (see the **FRESET** command on page 171). Both the user-defined and default datums are reported by the **GEODETICDATUMS** log (see page 494).

Datum entries are indexed by name, which must be unique. The name “USER” is reserved for the **USEREXPDATUM** entry. “ECEF” is reserved as a generic Earth-Centered Earth-Fixed datum. “UNKNOWN” is also reserved.

The EPSG Geodetic Parameter Dataset ([www.epsg-registry.org/](http://www.epsg-registry.org/)) is a commonly-referenced database of coordinate reference systems and coordinate transformations. The EPSG code in this log is intended to correspond to the “GeodeticDatum” data type within that database. If you are using a custom datum, the EPSG code should be 0.

**Message ID: 2295**

#### **Abbreviated ASCII Syntax:**

```
GEODETICDATUM switch name epsg_code anchor semimajor_axis flattening
```

#### **Factory Default:**

```
GEODETICDATUM none
```

#### **ASCII Example:**

Save a new geodetic datum to NVM:

```
GEODETICDATUM save NAD83 (MA11) 1118 EARTH_FIXED 6378137.0 298.257222101
```

Delete an existing geodetic datum from NVM:

```
GEODETICDATUM delete NAD83 (MA11)
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GEODETICDATUM header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	switch	SAVE	1	Save the datum.	Enum	4	H
		DELETE	2	Delete the datum.			
3	name			Name of the datum.	Char [32]	variable	H+4
4	epsg_code			The EPSG code.	Ulong	4	variable
5	anchor	<i>See Table 43: Datum Anchors below</i>		The datum type.	Enum	4	variable
6	semimajor_axis	6300000.000 – 6400000.000		Semi-major axis of the datum's ellipsoid (meters)	Double	8	variable
7	flattening	290.000 – 305.000		Inverse flattening of the datum's ellipsoid (unitless)	Double	8	variable

Table 43: Datum Anchors

Binary	ASCII	Description
0	UNKNOWN	The anchor is unknown.
1	EARTH_FIXED	The datum is not anchored to a specific tectonic plate (e.g., ITRF2005, WGS84).
2	PLATE_FIXED	The datum is anchored to a tectonic plate (e.g., NAD83, ETRF89).

## 2.61 GGAQUALITY

*Customizes the GPGGA GPS quality indicator*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to customize the NMEA GPGGA GPS quality indicator. See also the **GPGGA** log on page 517.

This command also changes the GPS quality indicator in the NMEA2000 CAN logs.

**Message ID: 691**

**Abbreviated ASCII Syntax:**

```
GGAQUALITY #entries pos_type quality
```

**Input Example 1:**

```
GGAQUALITY 1 waas 2
```

Makes the WAAS solution type show 2 as the quality indicator.

**Input Example 2:**

```
GGAQUALITY 2 waas 2 NARROW_FLOAT 3
```

Makes the WAAS solution type show 2 and the NARROW\_FLOAT solution type show 3, as their quality indicators.

**Input Example 3:**

```
GGAQUALITY 0
```

Sets all the quality indicators back to the default.

Some solution types, see *Table 81: Position or Velocity Type* on page 433, share a quality indicator. For example, converged PPP and NARROW\_FLOAT all share an indicator of 5. This command can be used to customize an application to have unique indicators for each solution type. Sets all the quality indicators back to the default. Refer to *Table 107: GPS Quality Indicators* on page 519.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GGAQUALITY header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#entries	0-20		The number of position types that are being remapped (20 max)	Ulong	4	H
3	pos_type	See <i>Table 81: Position or Velocity Type</i> on page 433		The position type that is being remapped	Enum	4	H+4

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	quality	See <i>Table 107: GPS Quality Indicators</i> on page 519		The remapped quality indicator value that will appear in the GPGGA log for this position type	Ulong	4	H+8
...	Next solution type and quality indicator set, if applicable				Variable		

## 2.62 GLIDEINITIALIZATIONPERIOD

### *Configures the GLIDE initialization period*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command sets the initialization period for Relative PDP (GLIDE) when pseudorange measurements are used more heavily. During the initialization period, the PDP output position is not as smooth as during full GLIDE operation, but it helps to get better absolute accuracy at the start. The longer this period is, the better the absolute accuracy that can be attained. The maximum period that can be set through **GLIDEINITIALIZATIONPERIOD** is 1200 seconds.

**Message ID:** 1760

#### **Abbreviated ASCII Syntax:**

```
GLIDEINITIALIZATIONPERIOD initialization
```

#### **Factory Default:**

```
GLIDEINITIALIZATIONPERIOD 300
```

#### **ASCII Example:**

```
GLIDEINITIALIZATIONPERIOD 100
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	GLIDEINITIALIZATION PERIOD header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	initialization	0 -1200 s		Initialization period for GLIDE in seconds	Double	8	H

## 2.63 GLOECUTOFF

### Sets *GLONASS* satellite elevation cut-off

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the elevation cut-off angle for tracked GLONASS satellites. The receiver does not start automatically searching for a satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they were manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the GLOECUTOFF angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle and can be used in the following situations:

- The antenna is at a high altitude and can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction
- However, for GLONASS it is not recommended to use negative values because a receiver should not track both antipodal satellites that are broadcasting on the same frequency.

Care must be taken when using **GLOECUTOFF** because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command (see page 140) to set the cut-off angle for any system.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

**Message ID:** 735

**Abbreviated ASCII Syntax:**

```
GLOECUTOFF angle
```

**Factory Default:**

```
GLOECUTOFF 5.0
```

**ASCII Example:**

```
GLOECUTOFF 0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	GLOECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.64 HDTOUTTHRESHOLD

### *Controls GPHDT log output*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to control the output of the NMEA **GPHDT** log (see page 536). It sets a heading standard deviation threshold. Only heading information with a standard deviation less than this threshold can be output into a GPHDT message.

**Message ID:** 1062

#### **Abbreviated ASCII Syntax:**

```
HDTOUTTHRESHOLD thresh
```

#### **Factory Default:**

```
HDTOUTTHRESHOLD 2.0
```

#### **ASCII Example:**

```
HDTOUTTHRESHOLD 12.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	HDTOUTTHRESHOLD header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	thresh	0.0 - 180.0		Heading standard deviation threshold (degrees)	Float	4	H

## 2.65 HEADINGOFFSET

### *Adds heading and pitch offset values*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to add an offset in the heading and pitch values of the **HEADING2** log (see page 553) and **GPHDT** log (see page 536).

The unmodified heading value represents the angle from True North of the base to rover vector in a clockwise direction. In some installations, it may not be possible to place the rover antenna in the desired location, for instance to match the forward-facing direction of the vehicle.

**Figure 5: HEADINGOFFSET Example**

In the example above, the rover antenna (in brown) is offset from the forward direction of travel and the provided heading will look as if the land vehicle is "slipping". A Heading offset can help to account for that difference between heading output and actual course over ground. It is up to the user to accurately determine the offset to be applied to suit their scenario.

**Message ID: 1082**

**Abbreviated ASCII Syntax:**

```
HEADINGOFFSET headingoffsetindeg [pitchoffsetindeg]
```

**Factory Default:**

```
HEADINGOFFSET 0 0
```

**ASCII Example:**

```
HEADINGOFFSET 2 -1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	HEADINGOFFSET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	headingoffsetindeg	-180.0 - 180.0		Offset added to heading output (degrees). Default=0	Float	4	H
3	pitchoffsetindeg	-90.0 - 90.0		Offset added to pitch output (degrees). Default=0	Float	4	H+4

## 2.66 ICOMCONFIG

### *Configures IP virtual COM port*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This command is used for Ethernet set up and to configure the transport/application layer of the configuration.

Access to the ICOM ports can be restricted by turning on ICOM security using the **IPSERVICE** command (see page 196).

**Message ID:** 1248

#### Abbreviated ASCII Syntax:

```
ICOMCONFIG [port] protocol [endpoint [bindinterface]]
```

#### Factory Default:

```
ICOMCONFIG ICOM1 TCP :3001
ICOMCONFIG ICOM2 TCP :3002
ICOMCONFIG ICOM3 TCP :3003
ICOMCONFIG ICOM4 TCP :3004
ICOMCONFIG ICOM5 TCP :3005
ICOMCONFIG ICOM6 TCP :3006
ICOMCONFIG ICOM7 TCP :3007
```

#### ASCII Example:

```
ICOMCONFIG ICOM1 TCP :2000 All
```

Due to security concerns, configuring and enabling ICOM ports should only be done to receivers on a closed system, that is, board-to-board. NovAtel is not liable for any security breaches that may occur if not used on a closed system.

Field	Field Type	ASCII Value	Binary Value	Data Description	Format	Binary Bytes	Binary Offset
1	ICOMCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Data Description	Format	Binary Bytes	Binary Offset
2	port	THISPORT	6	Name of the port (default = THISPORT).	Enum	4	H
		ICOM1	23				
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
3	protocol	DISABLED	1	Will disable the service	Enum	4	H+4
		TCP	2	Use Raw TCP			
		UDP	3	Use Raw UDP			
4	endpoint	Host:Port For example: 10.0.3.1:8000 mybase.com:3000		Endpoint to wait on, or to connect to where host is a host name or IP address and port is the TCP/UDP port number. If host is blank, act as a server.	String [80]	variable <sup>1</sup>	H+8
5	bindInterface	ALL (default)	1	Not supported. Set to <i>ALL</i> for future compatibility.	Enum	4	H+88

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.67 INTERFACEMODE

### *Sets receive or transmit modes for ports*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to specify what type of data a particular port on the receiver can transmit and receive. The receive type tells the receiver what type of data to accept on the specified port. The transmit type tells the receiver what kind of data it can generate. For example, to accept RTCMV3 differential corrections, set the receive type on the port to RTCMV3.

It is also possible to disable or enable the generation or transmission of command responses for a particular port. Disabling of responses is important for applications where data is required in a specific form and the introduction of extra bytes may cause problems, i.e., RTCA, RTCM, RTCMV3 or CMR. Disabling a port prompt is also useful when the port is connected to a modem or other device that responds with data the RECEIVER does not recognize.

For applications running in specific interface modes, see *Table 44: Serial Port Interface Modes* on page 191, please set the appropriate interface modes before sending or receiving corrections. It is important that the port interface mode matches the data being received on that port. Mismatches between the interface mode and received data can result in CPU overloads.

When INTERFACEMODE port NONE NONE OFF is set, the specified port is disabled from interpreting any input or output data. Therefore, no commands or differential corrections are decoded by the specified port. When GENERIC is set for a port, it is also disabled but data can be passed through the disabled port and be output from an alternative port using the pass-through logs PASSCOM, PASSAUX and PASSUSB. See *PASSCOM, PASSAUX, PASSUSB, PASSETH1, PASSICOM, PASSNCOM* on page 639 for details on these logs along with the Operation chapter in the [OEM7 Installation and Operation User Manual](#) for information about pass-through logging. See also the **SERIALCONFIG** command on page 317. If you intend to use the **SERIALCONFIG** command (see page 317), ensure you do so before the **INTERFACEMODE** command on each port. The **SERIALCONFIG** command (see page 317) can remove the **INTERFACEMODE** command setting if the baud rate is changed after the interface mode is set. You should also turn break detection off using the **SERIALCONFIG** command (see page 317) to stop the port from resetting because it is interpreting incoming bits as a break command. If such a reset happens, the Interface mode will be set back to the default NOVATEL mode for both input and output.

### 2.67.1 SPAN Systems

The INTERFACEMODE of the receiver is also configured for the serial port dedicated to the IMU. This mode changes automatically upon sending a **CONNECTIMU** command (see page 889) and the change is reflected when logging this command. This is normal operation.

When the **CONNECTIMU** command (see page 889) is used to configure the IMU connected to the receiver, the correct interface mode for the IMU port is automatically set. The IMU port should not be altered using the **INTERFACEMODE** command in normal operation. Doing so may result in the loss of IMU communication.

**Message ID:** 3

**Abbreviated ASCII Syntax:**

```
INTERFACEMODE [port] rxtype txttype [responses]
```

**Factory Default:**

```
INTERFACEMODE COM1 NOVATEL NOVATEL ON
INTERFACEMODE COM2 NOVATEL NOVATEL ON

```

Are NovAtel receivers compatible with others on the market?

All GNSS receivers output two solutions: position and time. The manner in which they output them makes each receiver unique. Most geodetic and survey grade receivers output the position in electronic form (typically RS-232), which makes them compatible with most computers and data loggers. All NovAtel receivers have this ability. However, each manufacturer has a unique way of formatting the messages. A NovAtel receiver is not directly compatible with a Trimble or Ashtech receiver (which are also incompatible with each other) unless everyone uses a standard data format.

However, there are several standard data formats available. For position and navigation output there is the NMEA format. Real-time differential corrections use RTCM or RTCA format. For receiver code and phase data RINEX format is often used. NovAtel and all other major manufacturers support these formats and can work together using them. The NovAtel format measurement logs can be converted to RINEX using the utilities provided in NovAtel Connect.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	INTERFACEMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 32: Communications Port Identifiers</i> on page 136		Serial port identifier (default = THISPORT)	Enum	4	H
3	rxtype	See <i>Table 44: Serial Port Interface Modes</i> below		Receive interface mode	Enum	4	H+4
4	txtype	See <i>Table 44: Serial Port Interface Modes</i> below		Transmit interface mode	Enum	4	H+8
5	responses	OFF	0	Turn response generation off	Enum	4	H+12
		ON	1	Turn response generation on (default)			

**Table 44: Serial Port Interface Modes**

Binary Value	ASCII Value	Description
0	NONE	The port accepts/generates nothing. The port is disabled.
1	NOVATEL	The port accepts/generates NovAtel commands and logs.
2	RTCM	The port accepts/generates RTCM corrections.
3	RTCA	The port accepts/generates RTCA corrections.

Binary Value	ASCII Value	Description
4	CMR	The port accepts/generates CMR corrections.
5	Reserved	
6	Reserved	
7	IMU	This port supports communication with a NovAtel supported IMU.
8	RTCMNOCR	When RTCMNOCR is used as the <i>txtype</i> , the port generates RTCM corrections without the CR/LF appended. When RTCMNOCR is used as the <i>rxtype</i> , the port accepts RTCM corrections with or without the CR/LF appended.
9	Reserved	
10	TCOM1	<p>INTERFACEMODE tunnel modes. To configure a full duplex tunnel, configure the baud rate on each port. Once a tunnel is established, the baud rate does not change. Special characters, such as a BREAK condition, do not route across the tunnel transparently and the serial port is altered, see the <b>SERIALCONFIG</b> command on page 317. Only serial ports may be in a tunnel configuration: COM1, COM2, COM3 or AUX may be used.</p> <p>For example, configure a tunnel at 115200 bps between COM1 and AUX:</p> <pre>SERIALCONFIG AUX 115200 SERIALCONFIG COM1 115200 INTERFACEMODE AUX TCOM1 NONE OFF INTERFACEMODE COM1 TAUX NONE OFF</pre> <p>The tunnel is fully configured to receive/transmit at a baud rate of 115200 bps.</p>
11	TCOM2	
12	TCOM3	
13	TAUX <sup>1</sup>	
14	RTCMV3	The port accepts/generates RTCM Version 3.0 corrections.
15	NOVATELBINARY	The port only accepts/generates binary messages. If an ASCII command is entered when the mode is set to binary only, the command is ignored. Only properly formatted binary messages are responded to and the response is a binary message.
16-17	Reserved	
18	GENERIC	The port accepts/generates nothing. The <b>SEND</b> command (see page 314) or <b>SENDHEX</b> command (see page 316) from another port generate data on this port. Any incoming data on this port can be seen with PASSCOM logs on another port, see <b>PASSCOM</b> , <b>PASSAUX</b> , <b>PASSUSB</b> , <b>PASSETH1</b> , <b>PASSICOM</b> , <b>PASSNCOM</b> log on page 639.
19	IMARIMU	This port supports communication with an iMAR IMU.

<sup>1</sup>Only available on specific models.

Binary Value	ASCII Value	Description
20	MRTCA	The port accepts/generates Modified Radio Technical Commission for Aeronautics (MRTCA) corrections.
21-22	Reserved	
23	KVHIMU	This port supports communication with a KVH CG5100 IMU.
24-26	Reserved	
27	AUTO	For auto-detecting different RTK correction formats and incoming baud rate (over serial ports). The change of baud rate will not appear when <b>SERIALCONFIG</b> is logged as this shows the saved baud rate for that port.
28-34	Reserved	
35	NOVATELX	The port accepts/generates NOVATELX corrections.
36-40	Reserved	
41	KVH1750IMU	This port supports communication with a KVH 17xx series IMU.
42-45	Reserved	
46	TCCOM1	CCOM1 Tunnel
47	TCCOM2	CCOM2 Tunnel
48	TCCOM3	CCOM3 Tunnel
49	NOVATELMINBINARY	NovAtel binary message with a minimal header. Only available for CCOM ports.
50	TCCOM4	CCOM4 Tunnel
51	TCCOM5	CCOM5 Tunnel
52	TCCOM6	CCOM6 Tunnel
53-57	Reserved	
60	TSCOM1	SCOM1 Tunnel
61	TSCOM2	SCOM2 Tunnel
62	TSCOM3	SCOM3 Tunnel
63	TSCOM4	SCOM4 Tunnel
64	LUA	Lua stdin/stdout/stderr. Use the LUA PROMPT command to set this Interface Mode.

## 2.68 IONOCONDITION

### *Sets ionospheric condition*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to change the level of ionosphere activity that is assumed by the RTK positioning algorithms.

Only advanced users should use this command.

**Message ID:** 1215

**Abbreviated ASCII Syntax:**

```
IONOCONDITION mode
```

**Factory Default:**

```
IONOCONDITION AUTO
```

**ASCII Example:**

```
IONOCONDITION normal
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	IONOCONDITION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.		H	
2	mode	quiet	0	Receiver assumes a low level of ionosphere activity	Enum	4	H
		normal	1	Receiver assumes a medium level of ionosphere activity			
		disturbed	2	Receiver assumes a high level of ionosphere activity			
		auto	10	Receiver monitors the ionosphere activity and adapts behavior accordingly			

## 2.69 IPCONFIG

### *Configures network IP settings*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This command is used to configure static/dynamic TCP/IP properties for the Ethernet connection.

In addition to configuring an IP address and netmask for the interface, this command also includes a gateway address.

**Message ID:** 1243

#### Abbreviated ASCII Syntax:

```
IPCONFIG [interface_name] address_mode [IP_address [netmask [gateway]]]
```

#### Factory Default:

```
IPCONFIG ETHA DHCP
```

#### ASCII Examples:

```
IPCONFIG ETHA STATIC 192.168.74.10 255.255.255.0 192.168.74.1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	IPCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	interface name	ETHA	2	Name of the Ethernet interface (default = ETHA)	Enum	4	H
3	address mode	DHCP	1	Use Dynamic IP address	Enum	4	H+4
		STATIC	2	Use Static IP address			
4	IP address	ddd.ddd.ddd.ddd (For example: 10.0.0.2)		IP Address-decimal dot notation	String [16]	variable 1	H+8
5	netmask	ddd.ddd.ddd.ddd (For example: 255.255.255.0)		Netmask-decimal dot notation	String [16]	variable 1	H+24
6	gateway	ddd.ddd.ddd.ddd (For example: 10.0.0.1)		Gateway-decimal dot notation	String [16]	variable 1	H+40

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.70 IPSERVICE

### *Configure availability of networks ports/services*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

Use the **IPSERVICE** command to configure the availability of specific network ports/services. When disabled, the service does not accept incoming connections.

On most OEM7 receivers, the FTP Server is disabled by default. The exception is the PwrPak7 which has FTP enabled by default.

We have found two problems in the Microsoft® FTP clients contained within the Internet Explorer® and Edge browsers which make them unsuitable for retrieving files from a NovAtel receiver. When using a Windows® computer to transfer files off a NovAtel receiver, we suggest using a 3rd party FTP client.

**Message ID:** 1575

#### **Abbreviated ASCII Syntax:**

```
IPSERVICE IPService switch
```

#### **Factory Default:**

```
IPSERVICE WEB_SERVER DISABLE (OEM719 and OEM7500)
```

```
IPSERVICE WEB_SERVER ENABLE (OEM729, OEM7600 OEM7700 and OEM7720)
```

```
IPSERVICE SECURE_ICOM DISABLE
```

#### **ASCII Example:**

```
IPSERVICE FTP_SERVER ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	IPSERVICE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	ipservice	NO_PORT	0	No port	Enum	4	H
		FTP_SERVER	1	FTP server port. For most OEM7 receivers the default = DISABLE. For the PwrPak7 the default = ENABLE.			
		WEB_SERVER	2	Web server port For most OEM7 receivers the default = ENABLE. For the OEM7500 and OEM719 the default = DISABLE.			
		SECURE_ICOM	3	Enables or disables security on ICOM ports.  When security is enabled, a login is required as part of the connection process (see the <b>LOGIN</b> command on page 220).  Default = DISABLE  <b>Note:</b> Security in this sense means users must supply a name and password before being allowed to enter commands on the ICOM ports. It does not mean there is data encryption			
3	switch	DISABLE	0	Disable the IP service specified.	Enum	4	H+4
		ENABLE	1	Enable the IP service specified.			

## 2.71 ITBANDPASSCONFIG

### *Enable and configure bandpass filter on receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to apply a bandpass filter at a certain frequency to mitigate interference in the pass band of GNSS signals. The **ITBANDPASSBANK** log (see page 570) provides information on the allowable configuration settings for each frequency band. The bandpass filter is symmetrical in nature, which means that specifying one cutoff frequency will apply a cutoff on both the low side and high side of the signal's center frequency. Only one filter can be applied for each signal.

To enable a filter on the signal received from the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), use the **ITBANDPASSCONFIG\_1** command.

On OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7 receivers, any filter enabled for GPS L2 or GLONASS L2 on the secondary antenna will be applied to both GPS L2 and GLONASS L2. For this reason, care must be taken to avoid attenuating the signals with a bandpass filter that is too narrow in bandwidth. The recommended maximum lower cutoff frequency is 1221 MHz. The recommended minimum upper cutoff frequency is 1254 MHz.

**Message ID:** 1999

#### Abbreviated ASCII Syntax:

```
ITBANDPASSCONFIG frequency switch [cutofffrequency]
```

#### ASCII Example:

```
ITBANDPASSCONFIG gpsl5 enable 1165.975
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITBANDPASS CONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	frequency	See <i>Table 51: Frequency Types</i> on page 208		Set the frequency band on which to apply the filter	Enum	4	H
3	switch	DISABLE	0	Disable filter	Enum	4	H+4
		ENABLE	1	Enable filter			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	cutofffrequency			Cut off frequency for band pass filter (MHz). (default = 0)  Refer to <b>ITBANDPASSBANK</b> log (see page 570) for the allowable values.	Float	4	H+8

## 2.72 ITDETECTCONFIG

### *Enable interference detection on receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to enable or disable interference detection on the receiver. It is applicable to both Spectral Analysis Detection and Statistical Analysis Detection at the same time. Detection can be enabled on all RF paths, only one RF path (L1, L2, or L5), or no RF paths. By default, only the RF paths connecting to the first antenna are enabled.

To start interference detection on the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), use the **ITDETECTCONFIG\_1** command. The interference detection results for the secondary antenna are shown in the **ITDETECTSTATUS\_1** log.

Enabling interference detection on both antennas slows down interference detection. In most installations, the primary and secondary antennas will be impacted by the same interference signal. Therefore, enabling interference detection on both antennas will slow down detection and may provide only limited benefits.

**Message ID:** 2143

#### Abbreviated ASCII Syntax:

```
ITDETECTCONFIG RFPATH [reserved1] [reserved2] [reserved3]
```

#### Factory Default:

```
ITDETECTCONFIG all
```

#### ASCII Example:

```
ITDETECTCONFIG L1
ITDETECTCONFIG none
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITDETECTCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	RFPATH	See <i>Table 45: RF Path Selection</i> on the next page		RF path selected for detection. By default, all paths are turned on. The receiver will cycle through all active paths.	Enum	4	H
3	reserved1	0		Reserved parameter	Ulong	4	H+4
4	reserved2	0		Reserved parameter	Ulong	4	H+8
5	reserved3	0		Reserved parameter	Ulong	4	H+12

**Table 45: RF Path Selection**

ASCII Value	Binary Value	Description
NONE	0	Turn off detection on all paths
ALL	1	Turn on detection on all paths (cycle through all active paths)
L1	2	Turn on detection only on L1 path
L2	3	Turn on detection only on L2 path
L5	4	Turn on detection only on L5 path

## 2.73 ITFRONTENDMODE

### Configure the front end mode settings

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to configure the front end mode for the L1, L2 and L5 RF paths to use the default third-order CIC mode or HDR (High Dynamic Range) mode. The HDR mode is used in an interference environment to obtain best interference rejection in general. However, the power consumption will increase in this mode.

To configure the front end mode settings for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), use the **ITFRONTENDMODE\_1** command.

**Message ID:** 2039

#### Abbreviated ASCII Syntax:

```
ITFRONTENDMODE frequency mode
```

#### Factory Default

```
ITFRONTENDMODE L1 cic3
ITFRONTENDMODE L2 cic3
ITFRONTENDMODE LBAND cic3
ITFRONTENDMODE L5 cic3
```

#### ASCII Example:

```
ITFRONTENDMODE L1 hdr
```

On the OEM7500, the default mode for all frequency bands is HDR.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITFRONTENDMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	frequency	See <i>Table 46: Frequency Bands</i> on the next page		Set the frequency band for adjustment	Enum	4	H
3	mode	See <i>Table 47: Mode</i> on the next page		Select the desired mode	Enum	4	H+4

**Table 46: Frequency Bands**

Binary Value	ASCII Value	Description
2	L1	Selects the L1 frequency
3	L2	Selects the L2 frequency
4	LBAND	Selects the L-Band frequency
5	L5	Selects the L5 frequency

**Table 47: Mode**

Binary Value	ASCII Value	Description
0	CIC3	3rd order CIC (CIC3) mode (default)
1	HDR	High Dynamic Range (HDR) mode

## 2.74 ITPROGFILTCONFIG

### *Enable and configure filtering on the receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to set the programmable filter to be either a notch filter or a bandpass filter to mitigate interference in the pass band of GNSS signals. The notch filter is used to attenuate a very narrow band of frequencies (specified by the notch width) around the configured center frequency.

The bandpass filter is symmetrical in nature, which means that specifying one cutoff frequency will apply a cutoff on both the low side and high side of the spectrum center frequency.

The **ITPROGFILTBANK** log (see page 578) provides information on the allowable configuration settings for the programmable filter (i.e. the allowable settings for the notch filter and bandpass filter) for each frequency band. Only one filter can be applied for each frequency.

To enable a filter on the signal received from the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), use the **ITPROGFILTCONFIG\_1** command.

**Message ID: 2000**

#### Abbreviated ASCII Syntax:

```
ITPROGFILTCONFIG frequency filterid switch [filtermode] [cutofffreq]
[notchwidth]
```

#### ASCII Example:

```
ITPROGFILTCONFIG gpsl1 pf0 enable notchfilter 1580 1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITPROGFILT CONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	frequency	See <i>Table 51: Frequency Types</i> on page 208		Set the frequency band on which to apply the filter	Enum	4	H
3	filterid	See <i>Table 48: Programmable Filter ID</i> on the next page		Select the filter ID to use	Enum	4	H+4
4	switch	DISABLE	0	Disable the filter	Enum	4	H+8
		ENABLE	1	Enable the filter			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	filtermode	See Table 49: <i>Programmable Filter Mode</i> below		Configure the type of filter to use (default = NONE)	Enum	4	H+12
6	cutofffreq			Center frequency for notch filter or cut off frequency for bandpass filter (MHz). Refer to <b>ITPROGFILTBANK</b> log (see page 578) for the allowable values. (default = 0)	Float	4	H+16
7	notchwidth			Notch width (MHz). Refer to <b>ITPROGFILTBANK</b> log (see page 578) for the allowable values. (default = 0)	Float	4	H+20

Table 48: Programmable Filter ID

Binary Value	ASCII Value	Description
0	PF0	Programmable Filter 0
1	PF1	Programmable Filter 1

Table 49: Programmable Filter Mode

Binary Value	ASCII Value	Description
0	NOTCHFILTER	Configure the filter as a notch filter
1	BANDPASSFILTER	Configure the filter as a bandpass filter
2	NONE	Turn off filter If the switch parameter is set to ENABLED while the filtermode parameter is set to NONE, the system will return a parameter out of range message.

## 2.75 ITSPECTRALANALYSIS

### *Enable and configure spectral analysis on receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to view the spectrum in a range of frequencies. The **ITSPECTRALANALYSIS** command enables and configures the spectral analysis. The spectrum is viewed by plotting the PSD samples in the **ITPSDFINAL** log (see page 583).

Decreasing the update period or increasing the FFT size will impact receiver idle time. The idle time should be monitored to prevent adverse effects on receiver performance.

Due to the high volume of data, a higher bandwidth medium, such as USB or Ethernet, is recommended when monitoring signals using the Interference Toolkit.

To enable and configure spectral analysis on the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), use the **ITSPECTRALANALYSIS\_1** command.

**Message ID:** 1967

#### Abbreviated ASCII Syntax:

```
ITSPECTRALANALYSIS mode [frequency] [updateperiod] [FFTsize] [timeavg]
[integration_window]
```

#### Factory Default:

```
ITSPECTRALANALYSIS off
```

#### ASCII Example:

```
ITSPECTRALANALYSIS predecimation gps11 500 1K 20 1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITSPECTRAL ANALYSIS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	See <i>Table 50: Data Sources for PSD Samples</i> on the next page		Set the view mode.	Enum	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	frequency	See Table 51: Frequency Types on the next page		Set the frequency band to view.	Enum	4	H+4
4	updateperiod	50 to 100000		The spectrum update rate in milliseconds. The update period is limited by the FFT size chosen. For 32k the minimum update period is 100 ms and for 64k the minimum update period is 200 ms. (default = 1000)	Ulong	4	H+8
5	FFTsize	See Table 52: FFT Sizes on page 209		The frequency resolution of the spectrum. (default = 1k)	Enum	4	H+12
6	timeavg	0 to 50		Time averaging window in seconds. 0 means no time averaging. (default = 10)	Ulong	4	H+16
7	integration window	1 to 1024		The integration window size of FFT samples. 1 means no integration. (default = 5)	Ulong	4	H+20

Table 50: Data Sources for PSD Samples

Binary Value	ASCII Value	Description
0	OFF	Disable spectral analysis
1	PREDECIMATION	Perform spectrum analysis on the pre-decimated spectrum. This can be used to see a wide view of the spectrum for an RF path (L1, L2 or L5).
2	POSTDECIMATION	Perform spectrum analysis on the post-decimated spectrum. This is narrower than predecimation and is used to see the spectrum for a given signal.
3	POSTFILTER	Perform spectrum analysis on the post-filtered spectrum. This can be used when either bandpass or notch filters have been enabled to see the spectrum after the filters are applied.

The post-filter spectrum is not available for the Galileo AltBOC frequency. Only the pre-decimation and post-decimation spectrums are available for Galileo AltBOC.

Table 51: Frequency Types

Binary Value	ASCII Value	Description
0	GPSL1	GPS L1 frequency
1	GPSL2	GPS L2 frequency
2	GLONASSL1	GLONASS L1 frequency
3	GLONASSL2	GLONASS L2 frequency
4	Reserved	
5	GPSL5	GPS L5 frequency
6 <sup>1</sup>	LBAND	Inmarsat L-Band frequency
7	GALILEOE1	Galileo E1 frequency
8	GALILEOE5A	Galileo E5A frequency
9	GALILEOE5B	Galileo E5B frequency
10	GALILEOALTBOC	Galileo AltBOC frequency
11	BEIDOUB1	BeiDou B1 frequency
12	BEIDOUB2	BeiDou B2I frequency
13	QZSSL1	QZSS L1 frequency
14	QZSSL2	QZSS L2 frequency
15	QZSSL5	QZSS L5 frequency
16	QZSSL6	QZSS L6 frequency
17	GALILEOE6	Galileo E6 frequency
18	BEIDOUB3	BeiDou B3 frequency
19	GLONASSL3	GLONASS L3 frequency
20	NAVICL5	NavIC L5 frequency
21	BEIDOUB1C	BeiDou B1C frequency
22	BEIDOUB2A	BeiDou B2a frequency
23	BEIDOUB2B	BeiDou B2b frequency

<sup>1</sup>Must first enable L-Band using the ASSIGNLBANDBEAM command.

Table 52: FFT Sizes

Binary Value	ASCII Value	Description
0	1K	1K FFT, 1024 samples
1	2K	2K FFT, 2048 samples
2	4K	4K FFT, 4096 samples
3	8K	8K FFT, 8192 samples
4	16K	16K FFT, 16384 samples
5	32K	32K FFT, 32768 samples
6	64K	64K FFT, 65536 samples

The 64k FFT is not available in post-decimation or post-filter modes.

## 2.76 ITWARNINGCONFIG

### *Configure the sensitivity level for the Jammer Detected bit*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to configure the sensitivity level for setting the Jammer Detected bit in the Receiver Status word in the **RXSTATUS** log (see page 777). Warning level 0 is the most sensitive, while level 3 is the least sensitive. Warning level 0 means the Jammer Detected bit can be set even when minor interference is detected. By default, the warning level is set at 3.

On dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), the **ITWARNINGCONFIG** setting applies to both antenna inputs.

**Message ID:** 2289

#### Abbreviated ASCII Syntax

```
ITWARNINGCONFIG WarningLevel [Reserved]
```

#### Factory Default:

```
ITWARNINGCONFIG 3
```

#### ASCII Example:

```
ITWARNINGCONFIG 0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	ITWARNINGCONFIG header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	WarningLevel	0		Detection warning sensitivity level 0 = most sensitive 3 = least sensitive	Ulong	4	H
		1					
		2					
		3					
3	Reserved	0		Reserved	Ulong	4	H+4

## 2.77 J1939CONFIG

### Configure CAN network-level parameters

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to configure the CAN J1939 network-level parameters (NAME, etc).

Issuing this command may initiate a CAN 'Address Claim' procedure. The status of the node and address claim are reported in the **J1939STATUS** log (see page 586).

Once a "node" is configured using **J1939CONFIG**, and the "port" is configured to ON using CANCONFIG "port" ON, J1939CONFIG "node" cannot be entered again until the "port" is configured to "OFF" using CANCONFIG "port" OFF. (See the **CANCONFIG** command on page 99)

**Message ID: 1903**

#### Abbreviated ASCII Syntax:

```
J1939CONFIG node port [pref_addr [alt_addr_range_start] [alt_addr_range_end]
[mfgcode] [industry] [devclass] [devinstance] [func] [funcinstance]
[ECUinstance]]
```

#### Factory Default:

```
J1939CONFIG NODE1 CAN1 1C 0 FD 305 2 0 0 23 0 0
```

```
J1939CONFIG NODE2 CAN2 1C 0 FD 305 2 0 0 23 0 0
```

#### ASCII Example :

```
J1939CONFIG NODE1 CAN1 AA 0 FD 305 2 0 0 23 0 0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	J1939CONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	node	NODE1	1	Identifies the J1939 Node (i.e., CAN NAME)	Enum	4	H
		NODE2	2				
3	port	CAN1	1	Physical CAN port to use	Enum	4	H+4
		CAN2	2				
4	pref_addr	0x0 - 0xFD		Preferred CAN address. The receiver attempts to claim this address (default = 0x0)	Ulong	4	H+8
5	alt_addr_range_start	0x0 - 0xFD		When the pref_addr cannot be claimed, the receiver attempts to claim an address from this range. (default: 0x0)	Ulong	4	H+12

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
6	alt_addr_range_end	0x0 - 0xFD		End of alternative address range. (default: 0xFD)	Ulong	4	H+16
7	mfgcode	0-2047		NAME: Manufacturer Code. Refer to ISO 11783-5. (default: 0)	Ulong	4	H+20
8	industry	0 - 7		NAME: Industry Group (default: 2)	Ulong	4	H+24
9	devclass	0 - 127		NAME: Device Class (default: 0)	Ulong	4	H+28
10	devinstance	0 - 15		NAME: Device Class Instance (default: 0)	Ulong	4	H+32
11	func	0 - 255		NAME: Function (default: 23)	Ulong	4	H+36
12	funcinstance	0 - 31		NAME: Function instance (default: 0)	Ulong	4	H+40
13	ECUinstance	0 - 7		NAME: ECU Instance (default: 0)	Ulong	4	H+44

Due to current limitations in the CAN stack, NODE1 can only be associated with CAN1 and NODE2 can only be associated with CAN2. A mismatch combination results in an 'invalid parameter' error.

Node statistics are reported in the **J1939STATUS** log (see page 586).

## 2.78 LOCKOUT

### *Prevents the receiver from using a satellite*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to prevent the receiver from using a satellite in the solution computations.

The **LOCKOUT** command does not prevent the receiver from tracking an undesirable satellite.

**LOCKOUT** command and **UNLOCKOUT** command (see page 371) can be used with GPS, GLONASS, SBAS and QZSS PRNs.

This command must be repeated for each satellite to be locked out. See also the **UNLOCKOUT** command on page 371 and **UNLOCKOUTALL** command on page 372.

**Message ID:** 137

**Abbreviated ASCII Syntax:**

```
LOCKOUT prn
```

**Input Example:**

```
LOCKOUT 8
```

The **LOCKOUT** command removes one or more satellites from the solution while leaving other satellites available.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	LOCKOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	prn	Refer to <i>PRN Numbers</i> on page 48		Unique identifier for the satellite being locked out	Ulong	4	H

## 2.79 LOCKOUTSYSTEM

*Prevents the receiver from using a system*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to prevent the receiver from using all satellites in a system in the solution computations.

The **LOCKOUTSYSTEM** command does not prevent the receiver from tracking an undesirable satellite.

This command must be repeated for each system to be locked out. See also the **UNLOCKOUTSYSTEM** command on page 373 and **UNLOCKOUTALL** command on page 372.

**Message ID:** 871

**Abbreviated ASCII Syntax:**

```
LOCKOUTSYSTEM system
```

**Factory Defaults:**

```
LOCKOUTSYSTEM sbas
```

```
LOCKOUTSYSTEM navic
```

The **LOCKOUTSYSTEM** command removes one or more systems from the solution while leaving other systems available.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	LOCKOUTSYSTEM header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	system	See <i>Table 118: Satellite System</i> on page 561		A single satellite system to be locked out	Enum	4	H

## 2.80 LOG

### *Requests logs from the receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Many different types of data can be logged using different methods of triggering the log events. Every log element can be directed to any combination of the receiver's ports. The ontime trigger option requires the addition of the period parameter. See *Logs* on page 399 for further information and a complete list of data log structures. The LOG command tables in this section show the binary format followed by the ASCII command format.

The optional parameter [hold] prevents a log from being removed when the **UNLOGALL** command (see page 376), with its defaults, is issued. To remove a log which was invoked using the [hold] parameter requires the specific use of the **UNLOG** command (see page 374). To remove all logs that have the [hold] parameter, use the **UNLOGALL** command (see page 376) with the held field set to 1.

The [port] parameter is optional. If [port] is not specified, [port] is defaulted to the port that the command was received on.

1. The OEM7 family of receivers can handle 80 simultaneous log requests. If an attempt is made to log more than 80 logs at a time, the receiver responds with an Insufficient Resources error. Note that **RXSTATUSEVENTA** logs are requested on most ports by default and these logs count against the 80.
2. The user is cautioned that each log requested requires additional CPU time and memory buffer space. Too many logs may result in lost data and low CPU idle time. Receiver overload can be monitored using the idle-time field and buffer overload bits of the Receiver Status in any log header.
3. Only the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** log (see page 600), **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log (see page 603) and 'polled' log types are generated, on the fly, at the exact time of the mark. Synchronous and asynchronous logs output the most recently available data.
4. Use the ONNEW trigger with the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** log (see page 600) and **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log (see page 603).
5. Polled log types do not all allow fractional offsets.
6. If ONTIME trigger is used with asynchronous logs, the time stamp in the log does not necessarily represent the time the data was generated but rather the time when the log is transmitted.
7. Published logs are not placed in a queue if there is no physical or virtual connection when the log is generated. Thus, a log requested ONNEW or ONCHANGED that is in SAVECONFIG may not be received if it is published before connections are made. This can happen if there's no cable connected or if the communication protocol has not been established yet (e.g. CAN, Ethernet, USB, etc).
8. PwrPak7M variants do not support the FILE port.

**Message ID: 1**

#### **Abbreviated ASCII Syntax:**

```
LOG [port] message ONNEW
LOG [port] message ONCHANGED
LOG [port] message ONTIME period [offset [hold]]
LOG [port] message ONNEXT
```

```
LOG [port] message ONCE
LOG [port] message ONMARK
```

**Factory Default:**

```
LOG COM1 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG COM2 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG COM3 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG USB1 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG USB2 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG USB3 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM1 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM2 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM3 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM4 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM5 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM6 RXSTATUSEVENTA ONNEW 0 0 HOLD
LOG ICOM7 RXSTATUSEVENTA ONNEW 0 0 HOLD
```

**Abbreviated ASCII Example 1:**

```
LOG COM1 BESTPOS ONTIME 7 0.5 HOLD
```

The above example shows **BESTPOS** logging to com port 1 at 7 second intervals and offset by 0.5 seconds (output at 0.5, 7.5, 14.5 seconds and so on). The [hold] parameter is set so that logging is not disrupted by the **UNLOGALL** command (see page 376).

To send a log once, the trigger option can be omitted.

**Abbreviated ASCII Example 2:**

```
LOG COM1 BESTPOS ONCE
```

Using the NovAtel Connect utility there are two ways to initiate data logging from the receiver's serial ports. Either enter the **LOG** command in the *Console* window or use the interface provided in the *Logging Control* window. Ensure the Power Settings on the computer are not set to go into Hibernate or Standby modes. Data is lost if one of these modes occurs during a logging session.

**2.80.1 Binary**

Field	Field Type	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	LOG (binary) header	See <i>Table 3: Binary Message Header Structure</i> on page 34	This field contains the message header	-	H	0
2	port	See <i>Table 4: Detailed Port Identifier</i> on page 36	Output port	Enum	4	H
3	message	Any valid message ID	Message ID of the log to output	Ushort	2	H+4

Field	Field Type	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	message type	Bits 0-4 = Measurement source <sup>1</sup> Bits 5-6 = Format 00 = Binary 01 = ASCII 10 = Abbreviated ASCII, NMEA 11 = Reserved Bit 7 = Response Bit ( <i>Message Responses</i> on page 45) 0 = Original Message 1 = Response Message	Message type of log	Char	1	H+6
5	Reserved			Char	1	H+7
6	trigger	0 = ONNEW	Does not output current message but outputs when the message is updated (not necessarily changed)	Enum	4	H+8
		1 = ONCHANGED	Outputs the current message and then continues to output when the message is changed			
		2 = ONTIME	Output on a time interval			
		3 = ONNEXT	Output only the next message			
		4 = ONCE	Output only the current message (default). If no message is currently present, the next message is output when available.			

<sup>1</sup>Bits 0-4 are used to indicate the measurement source. For dual antenna receivers, if bit 0 is set, the log is from the secondary antenna.

Field	Field Type	Binary Value	Description	Format	Binary Bytes	Binary Offset
		5 = ONMARK	Output when a pulse is detected on the mark 1 input, MK11 <sup>1 2</sup>			
7	period	Valid values for the high rate logging are 0.01, 0.02, 0.05, 0.1, 0.2, 0.25 and 0.5. For logging slower than 1 Hz any integer value is accepted	Log period (for ONTIME trigger) in seconds  If the value entered is lower than the minimum measurement period, the command will be rejected. See the <a href="#">OEM7 Installation and Operation User Manual</a> , <a href="#">PwrPak7 Installation and Operation User Manual</a> or <a href="#">SPAN CPT7 Installation and Operation User Manual</a> for the maximum raw measurement rate to calculate the minimum period.	Double	8	H+12
8	offset	Offset for period (ONTIME trigger) in seconds.	A valid value is any integer (whole number) smaller than the period.  For example, to log data at 1 second, after every minute, set the period to 60 and the offset to 1.  These decimal values, on their own, are also valid: 0.1, 0.2, 0.25 or 0.5, as well as any multiple of the maximum logging rate defined by the receiver model. The offset cannot be smaller than the minimum measurement period supported by the model.	Double	8	H+20
9	hold	0 = NOHOLD	Allow log to be removed by the <b>UNLOGALL</b> command (see page 376)	Enum	4	H+28
		1 = HOLD	Prevent log from being removed by the default <b>UNLOGALL</b> command (see page 376)			

<sup>1</sup>Refer to the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more details on the MK11 pin. ONMARK only applies to MK11. Events on MK21 (if available) do not trigger logs when ONMARK is used. Use the ONNEW trigger with the MARKTIME, MARK2TIME, MARKPOS or MARK2POS logs.

<sup>2</sup>Once the 1PPS signal has hit a rising edge, for both MARKPOS and MARKTIME logs, a resolution of both measurements is 10 ns. As for the ONMARK trigger for other logs that measure latency, for example RANGE and POSITION logs such as BESTPOS, it takes typically 20-30 ms (50 ms maximum) for the logs to output information from the 1PPS signal. Latency is the time between the reception of the 1PPS pulse and the first byte of the associated log. See also the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** log on page 600 and the **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log on page 603.

**2.80.2 ASCII**

Field	Field Name	ASCII Value	Description	Format
1	LOG (ASCII) header	-	This field contains the command name or the message header depending on whether the command is abbreviated ASCII or ASCII respectively	-
2	port	<i>Table 4: Detailed Port Identifier on page 36</i>	Output port (default = THISPORT)	Enum
3	message	Any valid message name, with an optional A or B suffix	Message name of log to output	Char []
4	trigger	ONNEW	Output when the message is updated (not necessarily changed)	Enum
		ONCHANGED	Output when the message is changed	
		ONTIME	Output on a time interval	
		ONNEXT	Output only the next message	
		ONCE	Output only the current message (default)	
		ONMARK	Output when a pulse is detected on the mark 1 input, MK11 <sup>2, 3</sup>	
5	period	Any positive double value larger than the receiver's minimum raw measurement period	Log period (for ONTIME trigger) in seconds (default = 0) If the value entered is lower than the minimum measurement period, the command will be rejected. See the <a href="#">OEM7 Installation and Operation User Manual</a> , <a href="#">PwrPak7 Installation and Operation User Manual</a> or <a href="#">SPAN CPT7 Installation and Operation User Manual</a> for the maximum raw measurement rate to calculate the minimum period.	Double
6	offset	Any positive double value smaller than the period	Offset for period (ONTIME trigger) in seconds (default = 0) For example, if you want to log data, at 1 second after every minute, set the period to 60 and the offset to 1.	Double
7	hold	NOHOLD	To be removed by the <b>UNLOGALL</b> command (see page 376) (default)	Enum
		HOLD	Prevent log from being removed by the default <b>UNLOGALL</b> command (see page 376)	

## 2.81 LOGIN

### *Start a secure ICOM/SCOM connection to the receiver*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

When ICOM/SCOM ports have security enabled (see the **IPSERVICE** command on page 196), a session to the ICOM/SCOM port can be established but commands are refused until a valid **LOGIN** command is issued. Both the UserName and Password are required. The **LOGIN** command checks the supplied credentials against known UserNames/Passwords and determines if the login is successful or not. A successful login permits the secured ICOM/SCOM command interpreter to accept further commands and returns OK. An unsuccessful login does not release the secured ICOM/SCOM command interpreter and returns Login Failed.

Entering a **LOGIN** command on any command port other than the ICOM/SCOM port has no effect, regardless of whether the UserName/Password is correct. In this case, the appropriate response (OK or Login Failed) is returned, but there is no effect on the command interpreter.

When security is enabled, access to the port is restricted unless a valid name and password are supplied. It does not mean there is data encryption enabled. Username is case-insensitive and password is case-sensitive.

**Message ID:** 1671

#### **Abbreviated ASCII Syntax:**

```
LOGIN [commport] UserName Password
```

#### **ASCII Example:**

```
LOGIN ADMIN ADMINPASSWORD
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	LOGIN header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	commport	ICOM1	23	<p>The ICOM or SCOM port to log into.</p> <p>This is an optional parameter.</p> <p>If no value is entered, logs in to the ICOM port currently being used. (default=THISPORT)</p>	Enum	4	H
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
		SCOM1	49				
		SCOM2	50				
		SCOM3	51				
		SCOM4	52				
3	username			<p>Provide the user name for the login command.</p> <p>The user name is not case sensitive.</p>	String [32]	variable 1	H+4
4	password			<p>Provide the password for the user name.</p> <p>The password is case sensitive.</p>	String [28]	variable 1	variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.82 LOGOUT

### *End a secure ICOM/SCOM session started using the LOGIN command*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

Use the **LOGOUT** command to sign out of an ICOM/SCOM connection after a user has successfully logged in using the **LOGIN** command. After the sending the **LOGOUT** command, the ICOM/SCOM connection will not accept further commands, other than a new LOGIN command. The session itself is not ended. This only applies to ICOM/SCOM ports that have had security enabled (see the **IPSERVICE** command on page 196).

**Message ID:** 1672

#### **Abbreviated ASCII Syntax:**

```
LOGOUT [commport]
```

#### **ASCII Example:**

```
LOGOUT
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	LOGOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	commport	ICOM1	23	The ICOM or SCOM port from which to log out. This is an optional parameter. If no value is entered, logs out from the ICOM/SCOM port currently being used.	Enum	4	H
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
		SCOM1	49				
		SCOM2	50				
		SCOM3	51				
		SCOM4	52				

## 2.83 LUA

### *Configure Lua Interpreter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to configure the execution of the Lua interpreter on the receiver. Scripts that appear within the **LUAFILELIST** log (see page 596) can be executed by the Lua interpreter.

**Message ID:** 2049

#### Abbreviated ASCII Syntax:

```
LUA option [LuaInterpreterArguments]
```

#### Abbreviated ASCII Example:

```
lua start "printarguments.lua 1 2 3 4 5"
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	Lua header	-	-	Command header. See Messages for more information.	-	H	0
2	option	START	1	Start the Lua interpreter in the background. The file descriptors stdout, stdin and stderr will not be accessible outside the receiver.	Enum	4	H
		PROMPT	2	Start the Lua interpreter in interactive mode and connect stdout, stdio and stderr to the port on which the command was entered. The INTERFACEMODE of that port will be changed to LUA for both RX and TX.			
3	LuaInterpreterArguments	STRING		String containing Lua interpreter options including the name of the script file to run and arguments to pass to the script. This string must be enclosed in quotes if it contains any spaces. String arguments within the field <b>must</b> be enclosed by single quotes.	String [400]	Variable	H+4

The format of the Lua Interpreter Arguments is as follows as adapted from the standard Lua 5.3 interpreter:

```
[options] [script [args]]
```

Available options are:

- e stat execute string 'stat'
- i enter interactive mode after executing 'script'.  
(This is added to the arguments when using the PROMPT option of the  
LUA command)
- l name require library 'name'

## 2.84 MAGVAR

### Sets a magnetic variation correction

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The receiver computes directions referenced to True North (also known as geodetic north). The Magnetic Variation Correction command (MAGVAR) is used to navigate in agreement with magnetic compass bearings. The correction value entered here causes the "bearing" field of the navigate log to report bearing in degrees Magnetic. The receiver computes the magnetic variation correction when using the auto option. See *Figure 6: Illustration of Magnetic Variation and Correction* below.

The receiver calculates values of magnetic variation for given values of latitude, longitude and time using the International Geomagnetic Reference Field (IGRF) 2020 spherical harmonic coefficients and IGRF time corrections to the harmonic coefficients. (IGRF-2020 is also referred to as IGRF-13.) The model is intended for use up to the year 2025. Furthermore, the receiver will compute for years beyond 2025, but accuracy may be further reduced depending on the behavior of the magnetic pole.

**Message ID:** 180

#### Abbreviated ASCII Syntax:

```
MAGVAR type [correction [std dev]]
```

#### Factory Default:

```
MAGVAR correction 0 0
```

#### ASCII Example 1:

```
MAGVAR AUTO
```

#### ASCII Example 2:

```
MAGVAR CORRECTION 15 0
```

**Figure 6: Illustration of Magnetic Variation and Correction**

Magnetic North refers to the location of the Earth's Magnetic North Pole. Its position is constantly changing in various cycles over centuries, years and days. These rates of change vary and are not well understood. However, we are able to monitor the changes.

True North refers to the earth's spin axis, that is, at 90° north latitude or the location where the lines of longitude converge. The position of the spin axis does not vary with respect to the Earth.

The locations of these two poles do not coincide. Thus, a relationship is required between these two values for users to relate GNSS bearings to their compass bearings. This value is called the magnetic variation correction or declination.

GNSS does not determine where Magnetic North is nor do the satellites provide magnetic correction or declination values. However, OEM7 receivers store this information internally in look up tables so that when you specify that you want to navigate with respect to Magnetic North, this internal information is used. These values are also available from various information sources such as the United States Geological Survey (USGS). The USGS produces maps and has software which enables the determination of these correction values. By identifying your location (latitude and longitude), you can obtain the correction value. Refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	MAGVAR header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	AUTO	0	Use IGRF corrections	Enum	4	H
		CORRECTION	1	Use the correction supplied			
3	correction	± 180.0 degrees		Magnitude of correction (Required field if type = Correction)	Float	4	H+4
4	std_dev	± 180.0 degrees		Standard deviation of correction (default = 0)	Float	4	H+8

## 2.85 MARKCONTROL

### Controls processing of mark inputs

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to control the processing of the mark inputs. Using this command, the mark inputs can be enabled or disabled, polarity can be changed and a time offset and guard against extraneous pulses can be added.

The MARKxPOS and MARKxTIME logs have their outputs (and extrapolated time tags) pushed into the future (relative to the mark input (MKI) event) by the amount entered into the time bias field. In almost all cases, this value is set to 0, which is also the default setting (see *MARKPOS*, *MARK2POS*, *MARK3POS* and *MARK4POS* on page 600 and *MARK1TIME*, *MARK2TIME*, *MARK3TIME* and *MARK4TIME* on page 603).

**Message ID:** 614

#### Abbreviated ASCII Syntax:

```
MARKCONTROL signal [switch [polarity [timebias [timeguard]]]]
```

#### Factory Default:

```
MARKCONTROL MARK1 ENABLE
```

```
MARKCONTROL MARK2 ENABLE
```

#### ASCII Example:

```
MARKCONTROL MARK1 ENABLE NEGATIVE 50 100
```

**Figure 7: TTL Pulse Polarity**

If using an external device, such as a camera, connect the device to the receiver's I/O port. Use a cable that is compatible with both the receiver and the device. A MARKIN pulse can be a trigger from the device to the receiver. See also the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** command on page 600 and the **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** command on page 603.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	MARKCONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	signal	MARK1	0	Specifies which mark input the command should be applied to. Set to MARK1 for the Event1 input, MARK2 for Event2, MARK3 for Event3 and MARK4 for Event4. All of the mark inputs have 10 K pull-up resistors to 3.3 V and are leading edge triggered.	Enum	4	H
		MARK2	1				
		MARK3	2				
		MARK4	3	MARK3 and MARK4 are available only on the OEM7600, OEM7700 and OEM7720.			
3	switch	DISABLE	0	Disables or enables processing of the mark input signal for the input specified. If DISABLE is selected, the mark input signal is ignored. (default = ENABLE)	Enum	4	H+4
		ENABLE	1				
4	polarity	NEGATIVE	0	Optional field to specify the polarity of the pulse to be received on the mark input. See <i>Figure 7: TTL Pulse Polarity</i> on the previous page for more information. (default= NEGATIVE)	Enum	4	H+8
		POSITIVE	1				
5	timebias	Any valid long value		Optional value to specify an offset, in nanoseconds, to be applied to the time the mark input pulse occurs. (default =0)	Long	4	H+12
6	timeguard	default: 4 minimum: 2 Any valid Ulong value larger than the receiver's minimum raw measurement period <sup>1</sup>		Optional field to specify a time period, in milliseconds, during which subsequent pulses after an initial pulse are ignored.	Ulong	4	H+16

<sup>1</sup>See the Technical Specification appendices in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for the maximum raw measurement rate to determine the minimum period. If the value entered is lower than the minimum measurement period, the value is ignored and the minimum period is used.

## 2.86 MEDIAFORMAT

### *Format the media for PwrPak7*

Platform: PwrPak7

PwrPak7M variants do not support this command.

Formats the specified media as FAT32, using PwrPak7 specific cluster size and other parameters.

Only the internal flash memory can be formatted.

Entering this command results in complete loss of all data stored on the media.

Entering this command initiates the format operation. An error is reported if formatting could not be initiated, for example due to the media being disconnected.

Formatting progress can be observed using the **FILESYSTEMSTATUS** log on page 472, which will report *BUSY*, followed by *MOUNTED*.

The receiver may reboot in the process.

**Message ID: 2128**

**Abbreviated ASCII Syntax:**

```
MEDIAFORMAT MassStorage
```

**Example:**

```
MEDIAFORMAT INTERNAL_FLASH
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	MEDIAFORMAT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MassStorage	INTERNAL_FLASH	4	Format the internal memory in the PwrPak7.	Enum	4	H

## 2.87 MODEL

### *Switches to a previously authorized model*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to switch the receiver between models previously added with the **AUTH** command (see page 77). When the **MODEL** command is issued, the receiver saves the specified model as the active model. The active model is now used on every subsequent start up. The **MODEL** command causes an automatic reset.

Use the **VALIDMODELS** log (see page 868) to output a list of available models on the receiver. Use the **VERSION** log (see page 873) to output the active model. Use the **AUTHCODES** log (see page 408) to output a list of the auth codes present on the receiver.

If the **MODEL** command is used to switch to an expired model, the receiver will reset and enter into an error state. Switch to a valid model to continue.

**Message ID:** 22

**Abbreviated ASCII Syntax:**

```
MODEL model
```

**Input Example:**

```
MODEL DDNRNNTBN
```

NovAtel uses the term models to refer to and control different levels of functionality in the receiver firmware. For example, a receiver may be purchased with an L1 only capability and be easily upgraded at a later time to a more feature intensive model, like L1/L2 dual-frequency. All that is required to upgrade is an authorization code for the higher model and the **AUTH** command (see page 77). Reloading the firmware or returning the receiver for service to upgrade the model is not required. Upgrades are available from [novatel.com/support](http://novatel.com/support).

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	MODEL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	model	Max 16 character null-terminated string (including the null)		Model name	String [max 16]	Variable <sup>1</sup>	H

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.88 MOVINGBASESTATION

### *Enables the use of a moving base station*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to enable or disable a receiver from transmitting corrections without a fixed position.

The moving base function allows you to obtain a centimeter level xyz baseline estimate when the base station and possibly the rover are moving. It is very similar to normal RTK, with one stationary base station and a moving rover (refer to Transmitting and Receiving Corrections in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#)). The BSLNXYZ log is an asynchronous 'matched' log that can be logged with the onchanged trigger to provide an accurate baseline between the base and rover.

Due to the latency of the reference station position messages, the following logs are not recommended to be used when in moving baseline mode: BESTXYZ, GPGST, MARKPOS, MARK2POS, MATCHEDPOS, MATCHEDXYZ, RTKPOS and RTKXYZ. The position error of these logs could exceed 100 m, depending on the latency of the reference station position message. If a rover position is required during moving basestation mode, then PSRPOS is recommended.

The **MOVINGBASESTATION** command must be used to allow the base to transmit messages without a fixed position.

1. Use the PSRPOS position log at the rover. It provides the best accuracy and standard deviations when the MOVINGBASESTATION mode is enabled.
2. This command supports RTCM V3 operation.
3. RTCM V3 support includes GPS + GLONASS operation.

**Message ID: 763**

**Abbreviated ASCII Syntax:**

```
MOVINGBASESTATION switch
```

**Factory Default:**

```
MOVINGBASESTATION disable
```

**ASCII Example:**

```
MOVINGBASESTATION ENABLE
```

Consider the case where there is a fixed base, an airplane flying with a moving base station near its front and a rover station at its tail end.

Corrections can be sent between the receivers in a 'daisy chain' effect, where the fixed base station sends corrections to the moving base station, which in turn can send corrections to the rover.

**Figure 8: Moving Base Station 'Daisy Chain' Effect**

When using this method, the position type is only checked at the fixed base station. Moving base stations will continue to operate under any conditions.

This command is useful for moving base stations doing RTK positioning at sea. A rover station is used to map out local areas (for marking shipping lanes, hydrographic surveying and so on), while the base station resides on the control ship. The control ship may not move much (parked at sea), but there is a certain amount of movement due to the fact that it is floating in the ocean. By using the **MOVINGBASESTATION** command, the control ship is able to use RTK positioning and move to new survey sites.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	MOVING BASESTATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Do not transmit corrections without a fixed position.	Enum	4	H
		ENABLE	1	Transmit corrections without a fixed position.			

## 2.89 NAVICECUTOFF

### *Sets elevation cut-off angle for NavIC satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to set the elevation cut-off angle for tracked NavIC satellites. The receiver does not start automatically searching for a NavIC satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the NAVICECUTOFF angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle; it could be used in these situations:

- The antenna is at a high altitude, and thus can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **NAVICECUTOFF** command because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command on page 140 to set the cut-off angle for all other systems.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

**Message ID:** 2134

**Abbreviated ASCII Syntax:**

```
NAVICECUTOFF angle
```

**Factory Default:**

```
NAVICECUTOFF 5.0
```

**ASCII Example:**

```
NAVICECUTOFF 10.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NAVICECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.90 NMEABEIDOUTALKER

### *Sets the NMEA Beidou talker ID*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to alter the behavior of the NMEA BeiDou talker ID. The default behavior is to use the legacy BeiDou Talker ID of 'BD' to maintain backward compatibility.

**Message ID:** 2258

**Abbreviated ASCII Syntax:**

```
NMEABEIDOUTALKER id
```

**Factory Default:**

```
NMEABEIDOUTALKER BD
```

**ASCII Example:**

```
NMEABEIDOUTALKER GB
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NMEABEIDOUTALKER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	id	GB	0	Use the NMEA ID	Enum	4	H
		BD	1	Use the legacy ID			

## 2.91 NMEAFORMAT

### Customize NMEA output

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use the NMEAFORMAT command to customize the NMEA GPGGA and GPGGALONG output.

Modifying the NMEA output will make it not compliant with the NMEA standard.

**Message ID: 1861**

#### Abbreviated ASCII Syntax:

```
NMEAFORMAT field format
```

#### Factory Default:

```
NMEAFORMAT GGA_LATITUDE 9.4
NMEAFORMAT GGA_LONGITUDE 10.4
NMEAFORMAT GGA_ALTITUDE .2
NMEAFORMAT GGALONG_LATITUDE 12.7
NMEAFORMAT GGALONG_LONGITUDE 13.7
NMEAFORMAT GGALONG_ALTITUDE .3
```

#### Example:

The following settings increase the precision of the GPGGA latitude and longitude fields:

```
NMEAFORMAT GGA_LATITUDE 11.6
NMEAFORMAT GGA_LONGITUDE 12.6
```

The following settings decrease the precision of the GPGGALONG latitude and longitude fields:

```
NMEAFORMAT GGALONG_LATITUDE 11.6
NMEAFORMAT GGALONG_LONGITUDE 12.6
```

The following setting stops the undulation fields of the GPGGALONG log being filled, making a log like the GPGGARTK log that was in NovAtel's OEM6 firmware:

```
NMEAFORMAT GGALONG_UNDULATION !0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NMEA FORMAT Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	Field	GGA_ LATITUDE	0	GPGGA latitude field	Enum	4	H
		GGA_ LONGITUDE	1	GPGGA longitude field			
		GGA_ ALTITUDE	2	GPGGA altitude (height) field			
		GGA_ UNDULATION	3	GPGGA undulation field			
		GGALONG_ LATITUDE	10	GPGGALONG latitude field			
		GGALONG_ LONGITUDE	11	GPGGALONG longitude field			
		GGALONG_ ALTITUDE	12	GPGGALONG altitude (height) field			
		GGALONG_ UNDULATION	13	GPGGALONG undulation field			

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	Format	Char[8]		<p>The Format field has a syntax similar to the printf function commonly found in programming languages. The format is:</p> <p style="padding-left: 40px;">!x.y</p> <p>Where:</p> <p style="padding-left: 40px;"><b>y</b> is the number of digits to display after the decimal point</p> <p style="padding-left: 40px;"><b>x</b> sets the minimum field width including the decimal point. X is optional if ! is not used. If the value requires fewer digits than x, leading zeros are added to the output.</p> <p style="padding-left: 40px;">! forces the field width to x. ! is optional. If a value exceeds the permitted width, the value will be saturated. If ! is used, y must be less than x.</p> <p>Examples (GGA_LATITUDE):</p> <p style="padding-left: 40px;">.5 = 5106.98120</p> <p style="padding-left: 40px;">2.3 = 5106.981</p> <p style="padding-left: 40px;">7.1 = 05107.0</p> <p style="padding-left: 40px;">!7.2 = 5106.98</p> <p style="padding-left: 40px;">!7.3 = 999.999</p>	Char[8]	8	H+4

## 2.92 NMEATALKER

### Sets the NMEA talker ID

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to alter the behavior of the NMEA talker ID. The talker is the first 2 characters after the \$ sign in the log header of the GPHDT, GPGLL, GPGRS, GPGSA, GPGST, GPGSV, GPRMB, GPRMC, GPVTG and GPZDA log outputs. The other NMEA logs are not affected by the NMEATALKER command.

On SPAN systems, the GPGGA position is always based on the position solution from the BESTPOS log which incorporate GNSS + INS solutions as well.

The default GPS NMEA messages (**NMEATALKER GP**) include specific information about only the GPS satellites that have a 'GP' talker solution, even when GLONASS satellites are present. As well, the default GPS NMEA message outputs GP as the talker ID regardless of the position type given in position logs such as BESTPOS. The **NMEATALKER AUTO** command changes this behavior so that the NMEA messages include all satellites in the solution and the talker ID changes according to those satellites.

If **NMEATALKER** is set to **auto** and there are systems other than GPS in the solution, there will be multiple sentences with different talker IDs.

For instance, if both GPS and GLONASS satellites are in the solution, two sentences with the GN talker ID are output. The first sentence contains information about the GPS and the second sentence contains the GLONASS satellites in the solution. In another example, if **NMEATALKER** is set to **auto** and there are only GLONASS satellites in the solution, the talker ID of this message is GL.

If the solution comes from SPAN, the talker ID is IN.

**Message ID: 861**

**Abbreviated ASCII Syntax:**

```
NMEATALKER id
```

**Factory Default:**

```
NMEATALKER gp
```

**ASCII Example:**

```
NMEATALKER auto
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NMEATALKER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	ID	GP	0	GPS (GP) only	Enum	4	H
		AUTO	1	GPS, GLONASS, Galileo, BeiDou, NavIC and/or QZSS			

The NMEATALKER command only affects NMEA logs that are capable of a GPS output. For example, GLMLA is a GLONASS-only log and the output will always use the GL talker. *Table 53: NMEA Talkers* below shows the NMEA logs and whether they use GPS (GP), GLONASS (GL), Galileo (GA), BeiDou (GB/BD), NavIC (GI), QZSS (GQ) or combined (GN) talkers with NMEATALKER AUTO.

**Table 53: NMEA Talkers**

Log	Talker IDs
GLMLA	GL
GPALM	GP
GPGGA	GP
GPGLL	GA or GB/BD or GI or GL or GN or GP or GQ
GPGRS	GA or GB/BD or GI or GL or GN or GP or GQ
GPGSA	GA or GB/BD or GI or GL or GN or GP or GQ
GPGST	GA or GB/BD or GI or GL or GN or GP or GQ
GPGSV	GA or GB/BD or GI or GL or GP or GQ
GPRMB	GA or GB/BD or GI or GL or GN or GP or GQ
GPRMC	GA or GB/BD or GI or GL or GN or GP or GQ
GPVTG	GA or GB/BD or GI or GL or GN or GP or GQ
GPZDA	GP

Which BeiDou NMEA Talker ID, GB or BD, is used in NMEA logs is determined by the setting in the **NMEABEIDOUTALKER** command on page 234.

## 2.93 NMEAVERSION

### *Sets the NMEA Version for Output*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to set the output version of NMEA messages.

**Message ID:** 1574

**Abbreviated ASCII Syntax:**

```
NMEAVERSION Version
```

**Factory Defaults:**

```
NMEAVERSION V31
```

**ASCII Example:**

```
NMEAVERSION V41
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NMEAVERSION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Version	V31	0	NMEA messages will be output in NMEA version 3.01 format.	Enum	4	H
		V41	1	NMEA messages will be output in NMEA version 4.11 format.			

## 2.94 NTRIPCONFIG

### Configures NTRIP

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets up and configures NTRIP communication.

**Message ID:** 1249

#### Abbreviated ASCII Syntax:

```
NTRIPCONFIG port type [protocol [endpoint [mountpoint [username [password
[bindinterface]]]]]]]
```

Mountpoint, username and password are all set up on the caster.

#### Factory Default:

```
NTRIPCONFIG ncom1 disabled
NTRIPCONFIG ncom2 disabled
NTRIPCONFIG ncom3 disabled
NTRIPCONFIG ncomX disabled
```

#### ASCII Example:

```
NTRIPCONFIG ncom1 client v1 :2000 calg0
```

#### ASCII example (NTRIP client):

```
NTRIPCONFIG ncom1 client v2 192.168.1.100:2101 RTCM3 calgaryuser calgarypwd
```

#### ASCII example (NTRIP server):

```
NTRIPCONFIG ncom1 server v1 192.168.1.100:2101 RTCM3 "" casterpwd
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NTRIPCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	NCOM1	26	Name of the port see <i>Table 32: Communications Port Identifiers</i> on page 136	Enum	4	H
		NCOM2	27				
		NCOM3	28				
3	type	DISABLED	1	NTRIP type	Enum	4	H+4
		CLIENT	2				
		SERVER	3				

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	protocol	DISABLED	1	Protocol (default V1)	Enum	4	H+8
		V1	2				
		V2	3				
5	endpoint	Max 80 character string		Endpoint to wait on or to connect to where host is a hostname or IP address and port is the TCP/UDP port number (default = 80)	String [80]	variable 1	H+12
6	mountpoint	Max 80 character string		Which mount point to use	String [80]	variable 1	variable
7	user name	Max 30 character string		Login user name	String [30]	variable 1	variable
8	password	Max 30 character string		Password	String [30]	variable 1	variable
9	bindInterface	ALL (default)	1	Not supported. Set to <i>ALL</i> for future compatibility.	Enum	4	variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.95 NTRIPSOURCETABLE

### Set NTRIP caster endpoints

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to set the NTRIP caster endpoints to be used for the **SOURCETABLE** log (see page 844).

**Message ID:** 1343

#### Abbreviated ASCII Syntax:

```
NTRIPSOURCETABLE endpoint [reserved1] [reserved2]
```

#### Factory Default:

```
NTRIPSOURCETABLE none
```

#### ASCII Example:

```
NTRIPSOURCETABLE base.station.novatel.ca:1001
```

```
NTRIPSOURCETABLE 192.168.1.100:1001
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	NTRIP SOURCETABLE header	-		Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Endpoint	Max 80 character string		Endpoint, in format of host:port, to connect to where the host is a hostname or IP address and port is the TCP/IP port number	String [80]	variable <sup>1</sup>	H
3	Reserved1	Reserved		Reserved	Ulong	4	variable
4	Reserved2	Reserved		Reserved	Ulong	4	variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.96 NVMRESTORE

### *Restores NVM data after an NVM failure*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to restore Non-Volatile Memory (NVM) data after a NVM Fail error. This failure is indicated by bit 15 of the receiver error word being set (see also **RXSTATUS** command on page 777 and **RXSTATUSEVENT** command on page 790). If corrupt NVM data is detected, the receiver remains in the error state and continues to flash an error code on the Status LED until the **NVMRESTORE** command is issued (refer to Built-In Status Tests in the [OEM7 Installation and Operation User Manual](#) for further explanation).

After entering the **NVMRESTORE** command and resetting the receiver, the communications link may have to be reestablished at a different baud rate from the previous connection.

**Message ID:** 197

**Abbreviated ASCII Syntax:**

NVMRESTORE

The possibility of NVM failure is extremely remote, however, if it should occur it is likely that only a small part of the data is corrupt. This command is used to remove the corrupt data and restore the receiver to an operational state. The data lost could be the user configuration, almanac, model or other reserved information.

## 2.97 NVMUSERDATA

### *Write User Data to NVM*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command writes the data provided in the data array to NVM. This data can be retrieved by issuing the command **LOG NVMUSERDATA**.

The user data is maintained through power cycles and a standard **FRESET** command (see page 171). To clear the user data, use the **FRESET USERDATA** command.

The user data may be deleted if the **NVMRESTORE** command (see page 244) is sent. **NVMRESTORE** should be used with caution and is meant for use only in the event of a NVM receiver error.

**Message ID:** 1970

#### **Abbreviated ASCII Syntax:**

```
NVMUSERDATA #bytes data
```

Field	Field Type	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	NVMUSERDATA header	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#bytes	-	Number of bytes of data to follow	Ulong	4	H
3	data	-	User input data up to a maximum of 2000 bytes. Data is entered in hexadecimal values with no separators between the values. For example, 1a2b3c4e	Uchar	2000	H+4

## 2.98 OUTPUTDATUM

### *Choose the datum to output PPP solutions in*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to select the geodetic datum and co-ordinate epoch in which solutions are output. If not set, the factory default value is the service datum and service epoch.

For either a plate-fixed or earth-fixed output datum, using a fixed epoch will compensate for plate motion such that you get repeatable co-ordinates over time for a location. Compensation is controlled using the **TECTONICSCOMPENSATIONSOURCE** command on page 353 and reported by the **TECTONICSCOMPENSATION** log (see page 847). The **TECTONICSCOMPENSATION** log will warn when operating in a region where tectonics compensation may be imprecise.

In order for solutions to be transformed to the requested datum, the datum selected must be in the list of datums shown in the **GEODETICDATUMS** log (see page 494).

To view the current datum, use the **BESTDATUMINFO** log (see page 426).

**Message ID: 1144**

#### Abbreviated ASCII Syntax:

```
OUTPUTDATUM name epoch_option epoch
```

#### Factory Default:

```
OUTPUTDATUM SERVICE SERVICE_EPOCH 0
```

#### ASCII Example:

To output co-ordinates in NAD83(CSRs), 2018:

```
OUTPUTDATUM NAD83 (CSRS) FIXED_EPOCH 2018.000
```

To output co-ordinates in ITRF2014, 2010.00:

```
OUTPUTDATUM ITRF2014 FIXED_EPOCH 2010.000
```

The **OUTPUTDATUM** command only accepts a non-zero epoch if the **FIXED\_EPOCH** option is specified. The earliest fixed epoch is 1900.

Do not mix the **OUTPUTDATUM** command and the **DATUM USER** commands.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	OUTPUTDATUM header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	name			The datum output.	Char [32]	variable	H
3	epoch_option	See <i>Table 54: Epoch Options</i> below		Epoch type to enter coordinates in.	Enum	4	variable
4	epoch	0 = unknown (default), else >=1900.00		Co-ordinate epoch (decimal year). Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable

Table 54: Epoch Options

Binary	ASCII	Description
0	SERVICE_EPOCH	Output coordinates in the epoch of the corrections (default)
1	FIXED_EPOCH	Output coordinates in the specified epoch
2	CURRENT_EPOCH	Output coordinates in the current epoch

## 2.99 PDPFILTER

### *Enables, disables or resets the PDP filter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to enable, disable or reset the Pseudorange/Delta-Phase (PDP) filter. The main advantages of the PDP implementation are:

- Smooths a jumpy position
- Bridges outages in satellite coverage (the solution is degraded from normal but there is at least a reasonable solution without gaps)

Enable the PDP filter to output the PDP solution in the **BESTPOS** log (see page 429), **BESTVEL** log (see page 443) and *NMEA Standard Logs* on page 631.

Refer to PDP and GLIDE Configurations in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for information on configuring your receiver for PDP or GLIDE operation.

### 2.99.1 GLIDE Position Filter

GLIDE is a mode of the PDP<sup>1</sup> filter that optimizes the position for consistency over time rather than absolute accuracy. This is ideal in clear sky conditions where the user needs a tight, smooth and consistent output. The GLIDE filter works best with SBAS. The PDP filter is smoother than a least squares solution but is still noisy in places. The GLIDE filter produces a very smooth solution with relative rather than absolute position accuracy. There should typically be less than 1 centimeter difference in error from epoch to epoch. GLIDE also works in single point and DGPS modes. See also the **PDPMODE** command on page 250 and the **PDPPOS** log on page 650, **PDPVEL** log on page 654 and **PDPXYZ** log on page 655.

**Message ID:** 424

**Abbreviated ASCII Syntax:**

```
PDPFILTER switch
```

**Factory Default:**

```
PDPFILTER disable
```

**ASCII Example:**

```
PDPFILTER enable
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PDPFILTER header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

<sup>1</sup>Refer also to the application note [APN-038: Pseudorange/Delta-Phase \(PDP\) and GLIDE Filters](#), available at [nova-tel.com/support/support-materials/application-notes](#).

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	switch	DISABLE	0	Disable the PDP filter.	Enum	4	H
		ENABLE	1	Enable the PDP filter.			
		RESET	2	Reset the PDP filter. A reset clears the filter memory so that the PDP filter can start over.			

## 2.100 PDPMODE

### *Selects the PDP mode and dynamics*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to select the mode and dynamics of the PDP filter.

The **PDPFILTER ENABLE** command (see the **PDPFILTER** command on page 248) must be entered before the **PDPMODE** command.

It is recommended that the ionotype be left at AUTO when using either normal mode PDP or GLIDE. See also the **SETIONOTYPE** command on page 330.

**Message ID:** 970

#### Abbreviated ASCII Syntax:

```
PDPMODE mode dynamics
```

#### Factory Default:

```
PDPMODE normal auto
```

#### ASCII Example:

```
PDPMODE relative dynamic
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PDPMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	NORMAL	0	In RELATIVE or GLIDE mode, GLIDE performance is optimized to obtain a consistent error in latitude and longitude over time periods of 15 minutes or less, rather than to obtain the smallest absolute position error. See also <i>GLIDE Position Filter</i> on page 248 for GLIDE mode additional information.	Enum	4	H
		RELATIVE	1				
		GLIDE	3	GLIDE mode is the same as RELATIVE mode.			
3	dynamics	AUTO	0	Auto detect dynamics mode	Enum	4	H+4
		STATIC	1	Static mode			
		DYNAMIC	2	Dynamic mode			

## 2.101 PGNCONFIG

### *Configure NMEA2000 PGNs.*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to configure the PGNs of the proprietary NMEA 2000 fast-packet messages the OEM7 receivers produce.

The receiver must be reset after issuing a **SAVECONFIG** command (see page 302) for all the configuration changes to take affect.

**Message ID: 1892**

#### **Abbreviated ASCII Syntax:**

```
PGNCONFIG message_id pgn priority
```

#### **Factory Default:**

```
PGNCONFIG INSPVACMP 130816 7
PGNCONFIG INSPVASDCMP 130817 7
```

#### **ASCII Example:**

```
PGNCONFIG INSPVACMP 129500 3
```

This example sets the INSPVACMP message to PGN 129500 with priority 3.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PGNCONFIG header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	message_id	INSPVACMP	1889	NovAtel message ID	Ulong	4	H
		INSPVASDCMP	1890				
3	pgn	0 to 4294967295		PGN to use for message_id	Ulong	4	H+4
4	priority	0 - 7		CAN priority to use	Uchar	1	H+8

## 2.102 POSAVE

### *Implements base station position averaging*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command implements position averaging for base stations. Position averaging continues for a specified number of hours or until the estimated averaged position error is within specified accuracy limits. Averaging stops when the time limit or the horizontal standard deviation limit or the vertical standard deviation limit is achieved. When averaging is complete, the **FIX POSITION** command is automatically invoked. See the **FIX** command on page 160.

If differential logging is initiated, then issue the **POSAVE** command followed by the **SAVECONFIG** command (see page 302). The receiver averages positions after every power on or reset. It then invokes the **FIX POSITION** command to enable it to send differential corrections.

**Message ID:** 173

#### Abbreviated ASCII Syntax:

```
POSAVE state [maxtime [maxhstd [maxvstd]]]
```

#### Factory Default:

```
POSAVE off
```

#### ASCII Example 1:

```
POSAVE on 24 1 2
```

#### ASCII Example 2:

```
POSAVE OFF
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	POSAVE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	state	ON	1	Enable position averaging	Enum	4	H
		OFF	0	Disable position averaging			
3	maxtime	0.01 - 100 hours		Maximum amount of time that positions are to be averaged (default=0.01)	Float	4	H+4
4	maxhstd	0 - 100 m		Desired horizontal standard deviation (default = 0.0)	Float	4	H+8
5	maxvstd	0 - 100 m		Desired vertical standard deviation (default = 0.0)	Float	4	H+12

The **POSAVE** command can be used to establish a new base station, in any form of survey or RTK data collection, by occupying a site and averaging the position until either a certain amount of time has passed or position accuracy has reached a user-specified level. User-specified requirements can be based on time or horizontal or vertical quality of precision.

## 2.103 POSTIMEOUT

### *Sets the position time out*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the time out value for the position calculation in seconds.

In position logs, for example **BESTPOS** log (see page 429) or **PSRPOS** log (see page 674), when the position time out expires, the Position Type field is set to NONE. Other field values in these logs remain populated with the last available position data. Also, the position is no longer used in conjunction with the almanac to determine what satellites are visible.

**Message ID:** 612

#### Abbreviated ASCII Syntax:

```
POSTIMEOUT sec
```

#### Factory Default:

```
POSTIMEOUT 600
```

#### ASCII Example:

```
POSTIMEOUT 1200
```

When performing data collection in a highly dynamic environment (for example, urban canyons or in high speed operations), you can use **POSTIMEOUT** to prevent the receiver from outputting calculated positions that are too old. Use **POSTIMEOUT** to force the receiver position type to NONE. This ensures that the position information being used in the **BESTPOS** log (see page 429) or **PSRPOS** log (see page 674) is based on a recent calculation. All position calculations are then recalculated using the most recent satellite information.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	POSTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	sec	0-86400		Time out in seconds	Ulong	4	H

## 2.104 PPPBASICCONVERGEDCRITERIA

### *Configures decision for PPP Basic convergence*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **PPPBASICCONVERGEDCRITERIA** command sets the threshold that determines if the solution has converged for lower accuracy PPP solutions. These are the PPP solutions reported with the PPP\_BASIC and PPP\_BASIC\_CONVERGING position types.

The convergence threshold for high-accuracy PPP solutions (reported with PPP and PPP\_CONVERGING position types) is set using the **PPPCONVERGEDCRITERIA** command (see page 256).

Relaxing the convergence threshold shortens the time before a PPP solution is reported as converged. However, it does not alter solution behavior. During the initial PPP solution period, the positions can have decimeter error variation. Only relax the convergence threshold if the application can tolerate higher solution variability.

**Message ID:** 1949

**Abbreviated ASCII Syntax:**

```
PPPBASICCONVERGEDCRITERIA criteria tolerance
```

**Factory Default:**

```
PPPBASICCONVERGEDCRITERIA horizontal_stddev 0.60
```

**ASCII Example:**

```
PPPBASICCONVERGEDCRITERIA total_stddev 0.45
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPBASIC CONVERGED CRITERIA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Criteria	TOTAL_STDDEV	1	Use the total, 3D, standard deviation	Enum	4	H
		HORIZONTAL_STDDEV	2	Use the horizontal, 2D, standard deviation			
3	Tolerance			Tolerance (m)	Float	4	H+4

## 2.105 PPPCONVERGEDCRITERIA

### *Configures decision for PPP convergence*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **PPPCONVERGEDCRITERIA** command sets the threshold that determines if the solution has converged for high-accuracy PPP solutions. These are the PPP solutions reported with the PPP and PPP\_CONVERGING position types.

The convergence threshold for lower accuracy PPP solutions (reported with PPP\_BASIC and PPP\_BASIC\_CONVERGING position types) is set using the **PPPBASICCONVERGEDCRITERIA** command (see page 255).

Relaxing the convergence threshold shortens the time before a PPP solution is reported as converged. However, it does not alter solution behavior. During the initial PPP solution period, the positions can have decimeter error variation. Only relax the convergence threshold if the application can tolerate higher solution variability.

**Message ID:** 1566

#### Abbreviated ASCII Syntax:

```
PPPCONVERGEDCRITERIA criteria tolerance
```

#### Factory Default:

```
PPPCONVERGEDCRITERIA horizontal_stddev 0.32
```

#### ASCII Example:

```
PPPCONVERGEDCRITERIA total_stddev 0.15
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPP CONVERGED CRITERIA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Criteria	TOTAL_STDDEV	1	Use the total, 3D, standard deviation	Enum	4	H
		HORIZONTAL_STDDEV	2	Use the horizontal, 2D, standard deviation			
3	Tolerance			Tolerance (m)	Float	4	H+4

## 2.106 PPPDYNAMICS

### *Sets the PPP dynamics mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command configures the dynamics assumed by the PPP filter. AUTO detects the antenna dynamics and adapts filter operation accordingly.

The automatic dynamics detection may be fooled by very slow, “creeping” motion, where the antenna consistently moves less than 2 cm/s. In such cases, the mode should explicitly be set to DYNAMIC.

**Message ID:** 1551

**Abbreviated ASCII Syntax:**

```
PPPDYNAMICS mode
```

**Factory Default:**

```
PPPDYNAMICS dynamic
```

**ASCII Example:**

```
PPPDYNAMICS auto
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPDYNAMICS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Mode	AUTO	0	Automatically determines dynamics mode	Enum	4	H
		STATIC	1	Static mode			
		DYNAMIC	2	Dynamic mode			

## 2.107 PPPDYNAMICSEED

### *Seed the PPP filter in any platform motion state*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command enables seeding of the PPP engine regardless of the receiver motion state. Accurate seeds can be used to improve initial PPP convergence and re-convergence following signal outages.

The seed position given by the **PPPDYNAMICSEED** command must be in a datum consistent with the PPP corrections that are in use. For TerraStar corrections, the datum is ITRF2014. The dynamic seed's time must refer to receiver time and cannot be more than 15 seconds in the past. A valid PPP solution (the **PPPPOS** log (see page 660) solution status is SOL\_COMPUTED) must have been computed for the same epoch as the seed in order for the seed to be used.

See the **PPPSEED** command on page 261 for stationary-only seeding and for other control over seeding.

**Message ID: 2071**

#### Abbreviated ASCII Syntax:

```
PPPDYNAMICSEED week seconds latitude longitude height northing_std_dev
easting_std_dev height_std_dev [northing_easting_covariance] [northing_
height_covariance] [easting_height_covariance]
```

#### Example :

```
PPPDYNAMICSEED 1817 247603 51.2086442297 -113.9810263055 1071.859 0.02 0.02
0.04
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPDYNAMICSEED header	-	-	Command header. See <i>Messages</i> on page 30 for more information.		H	0
2	week	0-9999		GPS Week number	Ulong	4	H
3	seconds	0-604800		Number of seconds into GPS week	Ulong	4	H+4
4	latitude	±90		Latitude (degrees)	Double	8	H+8
5	longitude	±180		Longitude (degrees)	Double	8	H+16
6	height	> -2000.0		Ellipsoidal height (meters)	Double	8	H+24
7	northing_std_dev			Northing standard deviation (meters)	Float	4	H+32
8	easting_std_dev			Easting standard deviation (meters)	Float	4	H+36
9	height_std_dev			Ellipsoidal height standard deviation (meters)	Float	4	H+40

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
10	northing_easting_covariance			Covariance between northing and easting components (meters)	Float	4	H+44
11	northing_height_covariance			Covariance between northing and height components (meters)	Float	4	H+48
12	easting_height_covariance			Covariance between easting and height components (meters)	Float	4	H+52

## 2.108 PPPRESET

### *Reset the PPP filter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command resets the PPP filter. After a reset, the PPP filter is restored to its initial state and PPP convergence will start over.

If deletion of the NVM-saved PPP seed information is also required, then a **PPPSEED CLEAR** command must be applied before the PPPRESET command. See the **PPPSEED** command on the next page.

**Message ID:** 1542

#### Abbreviated ASCII Syntax:

```
PPPRESET [Option]
```

#### ASCII Example :

```
PPPRESET
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Bytes	Binary Format	Binary Offset
1	PPPRESET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Option	FILTER	1	Reset the PPP filter. (default = FILTER)	4	Enum	H
		ALL	10	Reset the PPP filter and Corrections			

## 2.109 PPPSEED

### *Control the seeding of the PPP filter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **PPPSEED** command controls the seeding of the PPP filter. Accurate position seeding can accelerate PPP convergence.

**PPPSEED SET** is used to explicitly specify a seed position. The seed position must be in a datum consistent with the PPP corrections that will be used. For TerraStar corrections, this is ITRF2014. The **PPPSEED SET** command can only be used to give seed positions for stationary platforms. If the platform is moving, use the **PPPDYNAMICSEED** command (see page 258).

Caution must be exercised when using **PPPSEED SET**. While a good seed position can accelerate convergence, a bad seed position hurts performance. In some cases, a bad seed can prevent a solution from ever converging to a correct position. In other cases, a bad seed might be rejected immediately. In still other cases, the filter might operate with it for a time period only to reject it later. In this case, the filter position is partially reset, with a corresponding discontinuity in the PPP position.

**PPPSEED STORE** and **RESTORE** are intended to simplify seeding in operations where the antenna does not move between power-down and power-up. For example, in agricultural operations a tractor might be stopped in a field at the end of a day and then re-started the next day in the same position. Before the receiver is powered-down, the current PPP position could be saved to NVM using the **PPPSEED STORE** command, and then that position applied as a seed after power-up using **PPPSEED RESTORE**.

**PPPSEED AUTO** automates the STORE and RESTORE process. When this option is used, the PPP filter automatically starts using the stopping position of the previous day. For this command to work, the **PPPDYNAMICS** command (see page 257) setting must be AUTO so that the receiver can determine when it is static, or the filter must explicitly be told it is static using **PPPDYNAMIC STATIC**. Additionally, in order for the receiver to recall the saved seed, the **PPPSEED AUTO** command should be saved to NVM using the **SAVECONFIG** command (see page 302).

**Message ID: 1544**

#### Abbreviated ASCII Syntax:

```
PPPSEED option [latitude] [longitude] [height] [northing_std._dev.]
[easting_std._dev.] [height_std._dev.]
```

#### ASCII Example:

```
PPPSEED set 51.11635322441 -114.03819311672 1064.5458 0.05 0.05 0.05
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPSEED header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	option	CLEAR	0	Resets the stored seed, and prevents any auto seeding from occurring.	Enum	4	H
		SET	1	Immediately apply the specified coordinates as a seed position.			
		STORE	2	Store the current PPP position in NVM for use as a future seed.			
		RESTORE	3	Retrieve and apply a seed position that was previously saved in NVM via the STORE or AUTO options.			
		AUTO	4	Automatically store and restore PPP seed positions.			
3	latitude	±90		Latitude (degrees)	Double	8	H+4
4	longitude	±180		Longitude (degrees)	Double	8	H+12
5	height	> -2000.0		Ellipsoidal height (meters)	Double	8	H+20
6	northing std. dev.			Northing standard deviation (meters)	Float	4	H+28
7	easting std. dev.			Easting standard deviation (meters)	Float	4	H+32
8	height std. dev.			Ellipsoidal height standard deviation (meters)	Float	4	H+36
9	Reserved				Float	4	H+40

## 2.110 PPPSOURCE

*Specifies the PPP correction source*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command determines what corrections the PPP filter can use.

**PPPSOURCE NONE** stops any corrections from being used and immediately disables PPP.

**Message ID:** 1707

**Abbreviated ASCII Syntax:**

```
PPPSOURCE source
```

**Factory Default:**

```
PPPSOURCE auto
```

**ASCII Example:**

```
PPPSOURCE none
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPSOURCE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	source	NONE	0	Reject all PPP corrections. Disable the PPP filter	Enum	4	H
		TERRASTAR	1	Only accept TerraStar PPP corrections			
		VERIPOS	2	Only accept Veripos PPP corrections			
		TERRASTAR_L	8	Only accept TerraStar-L PPP corrections			
		TERRASTAR_C	10	Only accept TerraStar-C PPP corrections			
		AUTO	100	Automatically select and use the best corrections			

## 2.111 PPPTIMEOUT

### *Sets the maximum age of the PPP corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command sets the maximum age of the corrections that can be used to generate a PPP solution.

By default, the delay is 360 seconds. If the received corrections are older than the delay time set, the receiver will not produce a PPP solution.

For example, if L-Band tracking (which is providing us the PPP corrections) is lost for some reason, the receiver will continue generating a PPP solution using last available corrections until the age of corrections is older than the delay time. Note that using older corrections degrades the PPP solution quality.

**Message ID: 1560**

#### **Abbreviated ASCII Syntax:**

```
PPPTIMEOUT delay
```

#### **Factory Default:**

```
PPPTIMEOUT 360
```

#### **ASCII Example:**

```
PPPTIMEOUT 120
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPPTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	delay	5 to 900 s		Maximum corrections age	Ulong	4	H

## 2.112 PPSCONTROL

### *Controls the PPS output*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command provides a method for controlling the polarity, period and pulse width of the PPS output on the OEM7. The PPS output can also be disabled using this command.

This command is used to setup the PPS signal coming from the receiver. For example, to take measurements such as temperature or pressure, in synch with your GNSS data, the PPS signal can be used to trigger measurements in other devices.

The leading edge of the 1 PPS pulse is always the trigger/reference. For example:

```
PPSPCONTROL ENABLE NEGATIVE
```

generates a normally high, active low pulse with the falling edge as the reference, while:

```
PPSPCONTROL ENABLE POSITIVE
```

generates a normally low, active high pulse with the rising edge as the reference.

The pulse width is user-adjustable. The adjustable pulse width feature supports triggers/systems that need longer, or shorter, pulse widths than the default to register the pulse enabling a type of GPIO line for manipulation of external hardware control lines.

The switch states allow more control over disabling/enabling the PPS. The ENABLE\_FINETIME switch prevents the PPS from being enabled until FINE or FINESTEERING time status has been reached. The ENABLE\_FINETIME\_MINUTEALIGN switch is similar to ENABLE\_FINETIME with caveat that the PPS will still not be enabled until the start of the next 60 seconds (a 1 minute modulus) after FINE or FINESTEERING time status has been reached.

If the value of a field shared with PPSPCONTROL2 is changed in PPSPCONTROL, the value of that field is also changed in PPSPCONTROL2. For example, if the polarity is changed using the PPSPCONTROL command, the polarity is also changed in PPSPCONTROL2 command.

**Message ID: 613**

#### **Abbreviated ASCII Syntax:**

```
PPSPCONTROL [switch [polarity [period [pulsewidth]]]]
```

#### **Factory Default:**

```
PPSPCONTROL enable negative 1.0 1000
```

#### **ASCII Example:**

```
PPSPCONTROL enable positive 0.5 2000
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPSCONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disable the PPS	Enum	4	H
		ENABLE	1	Enable the PPS (default)			
		ENABLE_FINETIME	2	Enable the PPS only when FINE or FINESTEERING time status has been reached			
		ENABLE_FINETIME_MINUTEALIGN	3	Enable the PPS only when FINE or FINESTEERING time status has been reached AND the start of the next 60 seconds (1 minute modulus) has occurred			
3	polarity	NEGATIVE	0	Optional field to specify the polarity of the pulse to be generated on the PPS output. See <i>Figure 7: TTL Pulse Polarity</i> on page 227 for more information (default=NEGATIVE)	Enum	4	H+4
		POSITIVE	1				
4	period	0.05, 0.1, 0.2, 0.25, 0.5, 1.0, 2.0, 3.0,...20.0		Optional field to specify the period of the pulse, in seconds (default=1.0)	Double	8	H+8
5	pulsewidth	Any positive value less than or equal to half the period		Optional field to specify the pulse width of the PPS signal in microseconds. This value should always be less than or equal to half the period. (default=1000)	Ulong	4	H+16

## 2.113 PPSCONTROL2

### *Controls polarity, period, pulse width and estimated error limit of the PPS output*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The **PPSCONTROL2** command provides a method for controlling the polarity, period, pulse width, and estimated error limit of the PPS output on the OEM7. The PPS output can also be disabled using this command.

This command is identical to the **PPSCONTROL** command (see page 265) with the addition of a new parameter that represents the Estimated Error Limit.

If the value of a field shared with PPSCONTROL is changed in PPSCONTROL2, the value of that field is also changed in PPSCONTROL. For example, if the polarity is changed using the PPSCONTROL2 command, the polarity is also changed in PPSCONTROL command.

The estimated error limit sets an allowable  $\pm$  range for the clock offset. The PPS output is only enabled when the clock offset is within this range.

**Message ID:** 1740

**Abbreviated ASCII Syntax:**

```
PPSCONTROL2 [switch [polarity [period [pulsewidth [estimatederrorlimit]]]]]
```

**Factory default:**

```
PPSCONTROL2 enable negative 1.0 1000 0
```

**ASCII Example:**

```
PPSCONTROL2 enable_finetime positive 0.5 2000 10
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PPSCONTROL2 header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	switch	DISABLE	0	Disable the PPS	Enum	4	H
		ENABLE	1	Enable the PPS (default)			
		ENABLE_ FINETIME	2	Enable the PPS only when FINE or FINESTEERING time status has been reached			
		ENABLE_ FINETIME_ MINUTEALIGN	3	Enable the PPS only when FINE or FINESTEERING time status has been reached AND the start of the next 60 seconds (1 minute modulus) has occurred			
3	polarity	NEGATIVE	0	Optional field to specify the polarity of the pulse to be generated on the PPS output. See <i>Figure 7: TTL Pulse Polarity</i> on page 227 for more information (default = NEGATIVE).	Enum	4	H+4
		POSITIVE	1				
4	period	0.05, 0.1, 0.2, 0.25, 0.5, 1.0, 2.0, 3.0,...20.0		Optional field to specify the period of the pulse in seconds (default = 1.0).	Double	8	H+8
5	pulse width	Any value less than or equal to half the pulse period in microseconds.		Optional field to specify the pulse width of the PPS signal in microseconds. This value should always be less than or equal to half the period. (default = 1000).	Ulong	4	H+16
6	estimated error limit	0 to 2147483647 in nanoseconds		Optional field to specify the $\pm$ estimated error limit (in nanoseconds) for the clock offset (default = 0). The PPS output is only enabled when the clock offset is within this limit.  An estimated error limit of 0 removes the estimated error limit restraint on the PPS.	Long	4	H+20

## 2.114 PROFILE

### *Profile in Non-Volatile Memory (NVM)*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to configure multiple profiles in the NVM at receiver startup. The output is in the **PROFILEINFO** log (see page 667).

**Message ID:** 1411

#### Abbreviated ASCII Syntax:

```
PROFILE Option Name [command]
```

#### ASCII Examples:

```
PROFILE create Base
```

```
PROFILE createelement Base "log com1 versiona"
```

```
PROFILE createelement Base "serialconfig com2 115200"
```

```
PROFILE createelement Base "log com2 rtcml004 ontime 1"
```

```
PROFILE activate Base
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PROFILE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Option	Refer to <i>Table 55: Profile Option</i> on the next page		Profile options	Enum	4	H
3	Name			Profile name	String [Max 20]	variable 1	H+4
4	Command			Profile command	String [Max 200]	variable 1	variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

**Restrictions:**

1. Only supports up to a maximum of 9 profiles.
2. Only supports up to a maximum of 20 commands per profile.
3. Only supports up to a maximum of 200 characters long for each command.
4. Only supports up to a maximum of 1500 characters for all commands in one profile.
5. If one of the profiles is activated, the **SAVECONFIG** functionality is disabled.
6. All profiles are deleted by a **FRESET PROFILEINFO** command (see the **FRESET** command on page 171).
7. The receiver resets after a profile is activated.
8. Some commands optionally accept a port parameter and will default to **THISPORT** if no port is provided (e.g. **LOG** command). Since the commands in a profile are not sent from a port **THISPORT** is undefined in this case. When adding such commands to a profile, be sure to specify the port for the command rather than letting the command use the default, which may result in incorrect behavior.
9. Commands that lead to a reset of the receiver are rejected by the **PROFILE** command (see page 269).

**Table 55: Profile Option**

Binary	ASCII	Description
0	Reserved	
1	CREATE	Create a profile
2	DELETE	Delete an existing profile
3	CREATEELEMENT	Create an element in an existing profile
4	DELETEELEMENT	Delete an existing element in an existing profile
5	ACTIVATE	Activate an existing profile
6	DEACTIVATE	Deactivate a running profile

## 2.115 PSRDIFFSOURCE

### *Sets the pseudorange differential correction source*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command determines what differential corrections the PSR and PDP (GLIDE) filters can use.

Differential corrections can be generated from RTK corrections. **PSRDIFFSOURCE RTK** enables this, allowing the PSR and PDP solutions to benefit from RTK corrections. An RTK-capable model is not required for this capability.

**PSRDIFFSOURCE NONE** stops any corrections from being used; the PSR and PDP solutions will revert to being uncorrected.

All types except NONE may revert to SBAS (if enabled) or SINGLE position types.

**Message ID:** 493

**Abbreviated ASCII Syntax:**

```
PSRDIFFSOURCE type [id]
```

**Factory Default:**

```
PSRDIFFSOURCE AUTO ANY
```

**ASCII Examples:**

1. Enable only SBAS:

```
PSRDIFFSOURCE SBAS
SBASCONTROL ENABLE AUTO
```

2. Enable differential from RTCM, with a fall-back to SBAS:

```
PSRDIFFSOURCE RTCM ANY
SBASCONTROL ENABLE AUTO
```

3. Disable all corrections:

```
PSRDIFFSOURCE NONE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PSRDIFFSOURCE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	See <i>Table 56: PSRDIFFSOURCE Type</i> on the next page		Correction type	Enum	4	H
3	id	Char[4] or ANY		Base station ID (default = ANY)	Char[4]	8	H+4

**Table 56: PSRDIFFSOURCE Type**

Binary	ASCII	Description
0	RTCM	Use RTCM version 2 corrections from the given ID if available or SBAS otherwise. RTCM ID: $0 \leq \text{RTCM ID} \leq 1023$ <b>or</b> ANY to accept all IDs.
1	RTCA	Use RTCA corrections from the given ID if available or SBAS otherwise. RTCA ID: A four-character string containing only alpha (a-z) or numeric characters (0-9) <b>or</b> ANY to accept all IDs.
5	SBAS	Use SBAS corrections such as WAAS, EGNOS and MSAS in the region they are available and applicable to. There are regions that are not covered by any SBAS satellite and so the solution will revert to uncorrected.  The ID is ignored for this correction type.
6	RTK	Use differential corrections that are generated from RTK corrections if available or SBAS otherwise.  The correction type used is determined by the setting of the <b>RTKSOURCE</b> command (see page 296).
10	AUTO	Use any available correction source. If both differential and SBAS sources are available, differential will be preferred.
11	NONE	Disables all differential correction types. Solution will revert to uncorrected.

## 2.116 PSRDIFFSOURCE TIMEOUT

### *Sets pseudorange differential correction source timeout*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

When multiple differential correction sources are available, this command allows the user to set a time in seconds, that the receiver will wait before switching to another differential source, if corrections from the original source are lost.

**Message ID:** 1449

#### Abbreviated ASCII Syntax:

```
PSRDIFFSOURCE TIMEOUT option [timeout]
```

#### Factory Default:

```
PSRDIFFSOURCE TIMEOUT AUTO
```

#### ASCII Example:

```
PSRDIFFSOURCE TIMEOUT auto
PSRDIFFSOURCE TIMEOUT set 180
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PSRDIFFSOURCE TIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	AUTO	1	Use AUTO or SET to set the time	Enum	4	H
		SET	2				
3	timeout	0 to 3600 sec		Specify the timeout (default=0)	Ulong	4	H+4

## 2.117 PSRDIFFTIMEOUT

### *Sets maximum age of pseudorange differential data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the maximum age of pseudorange differential correction data to use when operating as a rover station. Received pseudorange differential correction data, older than the specified time, is ignored. This time out period also applies to differential corrections generated from RTK corrections.

The RTCA Standard for scat-i stipulates that the maximum age of differential correction messages cannot be greater than 22 seconds. Therefore, for RTCA rover users, the recommended PSRDIFF delay setting is 22.

**Message ID:** 1450

**Abbreviated ASCII Syntax:**

```
PSRDIFFTIMEOUT delay
```

**Factory Default:**

```
PSRDIFFTIMEOUT 300
```

**ASCII Example:**

```
PSRDIFFTIMEOUT 60
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	PSRDIFFTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	delay	2 to 1000 s		Maximum pseudorange differential age	Ulong	4	H

## 2.118 QZSSECUTOFF

### Sets QZSS satellite elevation cutoff

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the elevation cut-off angle for tracked QZSS satellites. The receiver does not start automatically searching for a QZSS satellite until it rises above the cut-off angle (when satellite position is known). Tracked satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (see the **ASSIGN** command on page 70).

In either case, satellites below the QZSSECUTOFF angle are eliminated from the internal position and clock off-set solution computations.

This command permits a negative cut-off angle; it could be used in these situations:

- The antenna is at a high altitude, and thus can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Care must be taken when using **QZSSECUTOFF** command because the signals from lower elevation satellites are traveling through more atmosphere and are therefore degraded. Use of satellites below 5 degrees is not recommended.

Use the **ELEVATIONCUTOFF** command (see page 140) to set the cut-off angle for any system.

For dual antenna receivers, this command applies to both the primary and secondary antennas.

**Message ID:** 1350

**Abbreviated ASCII Syntax:**

```
QZSSECUTOFF angle
```

**Factory Default:**

```
QZSSECUTOFF 5.0
```

**ASCII Example**

```
QZSSECUTOFF 10.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	QZSSECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90 degrees		Elevation cutoff angle relative to the horizon	Float	4	H

## 2.119 RADARCONFIG

### Configure the Emulated Radar Output

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to configure the Emulated Radar (ER) output.

The ER signal is output on the **VARF** or **EVENT\_OUT1** pin of the receiver.

**Message ID:** 1878

#### Abbreviated ASCII Syntax:

```
RADARCONFIG switch [frequency_step [update_rate [response_mode
[threshold]]]]
```

#### Factory Default:

```
radarconfig disable
```

#### ASCII Example:

```
radarconfig enable 26.11 5hz 2 3.5
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RADARCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disables radar emulation	Enum	4	H
		ENABLE	1	Enables radar emulation			
3	freq_step	10.06 16.32 26.11 28.12 34.80 36.11		Frequency step per kilometer per hour. (default = 36.11 Hz/kph)	Double	8	H+4

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	update_rate	1HZ	1	Rate at which the output frequency is adjusted (default = 10HZ) <sup>1</sup>	Enum	4	H+12
		2HZ	2				
		5HZ	5				
		10HZ	10				
		20HZ	20				
5	resp_mode	See <i>Table 57: Response Modes</i> below		Specify how responsive radar emulation is to changes in velocity (Default = 500) <sup>1</sup>	Integer	4	H+16
6	threshold	2 to 50 kph		The speed threshold at which to switch between response mode 1000 and response mode 500. The threshold is only applicable when the response mode is set to 2. (default = 5 kph)	Double	8	H+20

Table 57: Response Modes

Mode	Description
1	Immediate. This results in the lowest latency at the cost of higher noise.
2	Automatically switch between 1000 and 500 depending on speed. When speed is below the Threshold parameter, use Response Mode 500. Otherwise, use Response Mode 1000.
500	Signal is minimally smoothed resulting in low latency but increased noise.
1000	Output signal is smoothed over a smaller window resulting in less latency than 2000 and less noise than 500.
2000	Output signal is smoothed to reduce noise at the cost of higher latency.

<sup>1</sup>The number of samples used for smoothing depends on both the update\_rate and resp\_mode parameters. For instance, if the update\_rate is 5 Hz and the resp\_mode is 2000 ms, the number of samples used will be 10.

## 2.120 RAIMMODE

### *Configures RAIM mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to configure Receiver Autonomous Integrity Monitoring (RAIM) operation. This command uses RTCA MOPS characteristics which defines the positioning accuracy requirements for airborne lateral navigation (LNAV) and vertical navigation (VNAV) at 3 stages of flight:

1. En route travel
2. Terminal (within range of air terminal)
3. Non-precision approach

In order to ensure that the required level of accuracy is available in these phases of flight, MOPS requires the computation of protection levels (HPL and VPL). MOPS has the following definitions that apply to NovAtel's RAIM feature:

**Horizontal Protection Level (HPL)** is a radius of the circle in the horizontal plane. Its center is at the true position, that describes the region, assured to contain the indicated horizontal position. It is the horizontal region where the missed alert and false alert requirements are met using autonomous fault detection.

**Vertical Protection Level (VPL)** is half the length of the segment on the vertical axis. Its center is at the true position, that describes the region, assured to contain the indicated vertical position when autonomous fault detection is used.

**Horizontal Alert Limit (HAL)** is a radius of the circle in the horizontal plane. Its center is at the true position, that describes the region, required to contain the indicated horizontal position with the required probability.

**Vertical Alert Limit (VAL)** is half the length of the segment on the vertical axis. Its center is at the true position, that describes the region, required to contain the indicated vertical position with certain probability.

**Probability of False Alert ( $P_{fa}$ )** is a false alert defined as the indication of a positioning failure, when a positioning failure has not occurred (as a result of false detection). A false alert would cause a navigation alert.

### 2.120.1 Detection strategy

NovAtel's RAIM detection strategy uses the weighted Least-Squares Detection (LSA) method. This method computes a solution using a LSA and is based on the sum of squares of weighted residuals. It is a comparison between a root sum of squares of residuals and a decision threshold to determine a pass/fail decision.

### 2.120.2 Isolation strategy

NovAtel RAIM uses the maximum residual method. Logically it is implemented as a second part of Fault Detection and Exclusion (FDE) algorithm for LSA detection method. Weighted LSA residuals are standardized individually and the largest residual is compared to a decision threshold. If it is more than the threshold, the observation corresponding to this residual is declared faulty.

**Message ID:** 1285

**Abbreviated ASCII Syntax:**

```
RAIMMODE mode [hal [val [pfa]]]
```

**Factory Default:**

```
RAIMMODE default
```

**Input Example:**

```
RAIMMODE user 100 100 0.01
```

```
RAIMMODE terminal
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RAIMMODE Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MODE	See <i>Table 58: RAIM Mode Types</i> below			Enum	4	H
3	HAL	$5 \leq \text{HAL} \leq 9999.99$		Horizontal alert limit (m) (Default = 0.0)	Double	8	H+4
4	VAL	$5 \leq \text{VAL} \leq 9999.99$		Vertical alert limit (m) (Default = 0.0)	Double	8	H+12
5	PFA	$(P_{fa}) = 1e^{-7} \leq P_{fa} \leq 0.25$		Probability of false alert (Default = 0.0)	Double	8	H+20

**Table 58: RAIM Mode Types**

Binary	ASCII	Description
0	DISABLE	Do not do integrity monitoring of least squares solution
1	USER	User will specify alert limits and probability of false alert
2	DEFAULT	Use NovAtel RAIM (default)
3	APPROACH	Default numbers for non-precision approach navigation modes are used - HAL = 556 m (0.3 nm), VAL = 50 m for LNAV/VNAV
4	TERMINAL	Default numbers for terminal navigation mode are used - HAL = 1 nm, no VAL requirement
5	ENROUTE	Default numbers for enroute navigation mode are used - HAL = 2 nm, no VAL requirement

## 2.121 REFERENCESTATIONTIMEOUT

### *Sets timeout for removing previously stored base stations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets how long the receiver will retain RTK base station co-ordinates. Shorter durations might be required if the receiver is operating in a VRS RTK network that recycles base station IDs quickly.

**Message ID:** 2033

#### Abbreviated ASCII Syntax:

```
REFERENCESTATIONTIMEOUT option [timeout]
```

#### Factory Default:

```
REFERENCESTATIONTIMEOUT AUTO
```

#### ASCII Example:

```
REFERENCESTATIONTIMEOUT SET 90
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	REFERENCESTATION TIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	AUTO	1	Sets the Timeout to 90 seconds <sup>1</sup> The Timeout field is optional for AUTO and has no effect	Enum	4	H
		SET	2	Must set the timeout value using the Timeout field 0 is not accepted when using the SET option			
3	timeout	1 to 3600 s		Specify the time	Ulong	4	H+4

<sup>1</sup>This behavior is subject to change.

## 2.122 RESET

### *Performs a hardware reset*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command performs a hardware reset. The receiver configuration reverts either to the factory default, if no user configuration was saved or the last **SAVECONFIG** settings. Refer to the **FRESET** command on page 171 and **SAVECONFIG** command on page 302.

The optional delay field is used to set the number of seconds the receiver is to wait before resetting.

**Message ID:** 18

#### Abbreviated ASCII Syntax:

```
RESET [delay]
```

#### Input Example

```
RESET 30
```

The **RESET** command can be used to erase any unsaved changes to the receiver configuration.

Unlike the **FRESET** command on page 171, the **RESET** command does not erase data stored in the NVM, such as Almanac and Ephemeris data.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RESET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	delay (0-60)			Seconds to wait before resetting (default = 0)	Ulong	4	H

## 2.123 RFINPUTGAIN

### Configure the Calibrated Antenna Gain (CAG)

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to select the mode (AUTO or MANUAL) of setting the CAG for the purpose of interference detection.

If auto mode is used, the receiver will automatically compute the CAG at start up. In this case it is assumed that the receiver is powered up with its antenna connected and no interference is present.

If the antenna is changed, either reset the receiver or reissue this command to allow receiver to re-compute the CAG.

If manual mode is used, the CAG input by the user is used by the receiver to detect interference.

The CAG is defined to be the cascaded RF gain before receiver input plus LNA noise figure (NF), counting active antenna LNA gain, in-line amplifier, RF cable or distribution loss prior to receiver input connector.

A typical GNSS active antenna (of reasonable quality) has a noise figure of ~2dB (dominated by the LNA in an active antenna).

$\text{RFINPUTGAIN} = \text{Cascaded Gain before receiver} + \text{LNA NF}$

**For advanced users.**

If using this command in manual mode, the antenna gain must be accurately measured when the system is not experiencing any interference. If an erroneous CAG is injected, the interference detection performance can be degraded.

**Message ID: 1658**

**Abbreviated ASCII Syntax:**

```
RFINPUTGAIN RFPATH [mode] [CAG]
```

**Factory Default:**

```
RFINPUTGAIN L1 AUTO
```

```
RFINPUTGAIN L2 AUTO
```

```
RFINPUTGAIN L5 AUTO
```

**ASCII Example:**

```
RFINPUTGAIN L1 MANUAL 30
```

```
RFINPUTGAIN L2 30
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RFINPUTGAIN header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	RFPATH	L1	2	RF path selection	Enum	4	H
		L2	3				
		L5	5				
3	mode	AUTO	0	Calibrated Antenna Gain (CAG) mode.	Enum	4	H+4
		MANUAL	1	Default = MANUAL			
4	CAG	0.0-100.0		Calibrated Antenna Gain value If the mode is MANUAL, a value for CAG must be entered.	Float	4	H+8

## 2.124 RTKANTENNA

*Specifies L1 phase center (PC) or ARP and enables/disables PC modeling*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to specify whether to use L1 phase center or Antenna Reference Point (ARP) positioning.

There is also an option to apply phase center variation modeling. If there are any conditions that make a selected mode impossible, the solution status in the position log will indicate an error or warning.

L1 ARP offsets and L2 ARP offsets can be entered using the **BASEANTENNAPCO** command on page 82 and **THISANTENNAPCO** command on page 355. Phase center variation parameters can be entered using the **BASEANTENNAPCV** command on page 84 and **THISANTENNAPCV** command on page 356.

Error states occur if either the rover does not have the necessary antenna information entered or the base is not sending sufficient information to work in the requested mode. An example of these error conditions is:

- Position reference to the ARP is requested but no rover antenna model is available

**Message ID:** 858

**Abbreviated ASCII Syntax:**

```
RTKANTENNA posref pcv
```

**Factory Default:**

```
RTKANTENNA unknown disable
```

**ASCII Example:**

```
RTKANTENNA arp enable
```

This command is used for high precision RTK positioning allowing application of antenna offset and phase center variation parameters.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKANTENNA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	posref	L1PC	0	L1 phase center position reference	Enum	4	H
		ARP	1	ARP position reference			
		UNKNOWN	2	Unknown position reference			
3	pcv	DISABLE	0	Disable PCV modeling	Enum	4	H+4
		ENABLE	1	Enable PCV modeling			
4	Reserved				Bool	4	H+8
5	Reserved				Bool	4	H+12

## 2.125 RTKASSIST

### *Enable or disable RTK ASSIST*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command enables or disables RTK ASSIST.

RTK ASSIST uses L-Band-delivered corrections to enable RTK operation to continue for extended durations if RTK corrections are lost. In order to use RTK ASSIST, a receiver with L-Band tracking capability and RTK ASSIST capability is needed. The duration of RTK ASSIST operation can be limited using the **RTKASSISTTIMEOUT** command (see page 286).

When active, RTK ASSIST is shown in the RTKPOS and BESTPOS extended solution status field (see *Table 84: Extended Solution Status* on page 436). The active status and further details on the RTK ASSIST status are available through the **RTKASSISTSTATUS** log on page 758.

For reliable RTK ASSIST performance, the RTK base station position must be within 1 meter of its true WGS84 position.

**Message ID:** 1985

**Abbreviated ASCII Syntax:**

```
RTKASSIST switch
```

**Factory Default:**

```
RTKASSIST enable
```

**ASCII Example:**

```
RTKASSIST disable
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKASSIST header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disable RTK ASSIST	Enum	4	H
		ENABLE	1	Enable RTK ASSIST			

## 2.126 RTKASSISTTIMEOUT

### *Set the maximum RTK ASSIST duration*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets how long the receiver will report an RTK solution when RTK is being maintained by RTK ASSIST. The maximum permitted duration of RTK ASSIST operation is determined by the subscription and receiver model. Values less than the subscription limit can be set using the **RTKASSISTTIMEOUT** command.

When RTK ASSIST is active, the **RTKTIMEOUT** command is disregarded. The maximum time that RTK will continue past an RTK corrections outage is controlled by **RTKASSISTTIMEOUT**.

**Message ID:** 2003

#### Abbreviated ASCII Syntax:

```
RTKASSISTTIMEOUT limit_type [limit_value]
```

#### Factory Default:

```
RTKASSISTTIMEOUT SUBSCRIPTION_LIMIT
```

#### ASCII Example:

```
RTKASSISTTIMEOUT USER_LIMIT 900
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKASSIST TIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	limit_type	SUBSCRIPTION _LIMIT	0	Use maximum permitted duration limit.	Enum	4	H
		USER_LIMIT	1	The maximum RTK ASSIST duration is user set, up to the limit permitted by the subscription and model.			
3	limit_value			Time out value in seconds. Only valid for the USER_ LIMIT Limit Type.	Ulong	4	H+4

## 2.127 RTKDYNAMICS

### *Sets the RTK dynamics mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to specify how the receiver looks at the data. There are three modes: STATIC, DYNAMIC and AUTO. The STATIC mode forces the RTK software to treat the rover station as though it were stationary.

DYNAMIC mode forces the software to treat the rover as though it were in motion. If the receiver is undergoing very slow, steady motion (<2.5 cm/s for more than 5 seconds), use DYNAMIC mode (as opposed to AUTO) to prevent inaccurate results and possible resets.

For reliable performance, the antenna should not move more than 1-2 cm when in STATIC mode.

**Message ID:** 183

**Abbreviated ASCII Syntax:**

```
RTKDYNAMICS mode
```

**Factory Default:**

```
RTKDYNAMICS dynamic
```

**ASCII Example:**

```
RTKDYNAMICS static
```

Use the STATIC option to decrease the time required to fix ambiguities and reduce the amount of noise in the position solution. If STATIC mode is used when the antenna is not static, the receiver will have erroneous solutions and unnecessary RTK resets.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKDYNAMICS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	AUTO	0	Automatically determines dynamics mode	Enum	4	H
		STATIC	1	Static mode			
		DYNAMIC	2	Dynamic mode			

## 2.128 RTKINTEGRCRITERIA

### *Report inaccurate fixed-integer RTK positions with float solution type*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command forces a fixed-integer RTK position to be reported as float if the estimated solution standard deviation exceeds a threshold.

Normally, a fixed-integer solution is very accurate. However, in some rarely-occurring situations, even a fixed-integer solution can become inaccurate; for example, if the DOP is high due to satellites not being visible. In such cases, the accuracy of the RTK solution might be worse than what is customarily expected from a fixed-integer solution. The **RTKINTEGRCRITERIA** command changes the solution type of these high standard deviation integer solutions to their float equivalent. `NARROW_INT`, for instance, becomes `NARROW_FLOAT`. Depending on the `GGAQUALITY` command setting, this will also impact the NMEA GGA quality flag.

**Message ID:** 2070

**Abbreviated ASCII Syntax:**

```
RTKINTEGRCRITERIA criteria threshold
```

**Factory Default:**

```
RTKINTEGRCRITERIA TOTAL_STDDEV 1.0
```

**ASCII Example:**

```
RTKINTEGRCRITERIA HORIZONTAL_STDDEV 0.25
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKINTEGRCRITERIA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	criteria	TOTAL_STDDEV	1	Test the threshold against the estimated total, 3D, standard deviation	Enum	4	H
		HORIZONTAL_STDDEV	2	Test the threshold against the estimated horizontal standard deviation			
3	threshold	0.01 m and higher		Estimated solution standard deviation (m) required for solution to be reported as integer	Float	4	H+4

## 2.129 RTKMATCHEDTIMEOUT

**Sets RTK filter reset time after corrections are lost**

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets the length of time the receiver continues to use the last RTK correction data once the corrections stop. Once this time is reached, the RTK filter is reset.

**Message ID:** 1447

**Abbreviated ASCII Syntax:**

```
RTKMATCHEDTIMEOUT timeout
```

**ASCII Example:**

```
RTKMATCHEDTIMEOUT 180
```

**Factory Default**

```
RTKMATCHEDTIMEOUT 300
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKMATCHEDTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	timeout	1 to 3600 s		Time out period	Ulong	4	H

## 2.130 RTKNETWORK

### *Specifies the RTK network mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Network RTK uses permanent base station installations, allowing kinematic GNSS users to achieve centimeter accuracies, without the need of setting up a GNSS base station, at a known site. This command sets the RTK network mode for a specific network. For more details on Network RTK, refer to the application note [APN-041 Network RTK](#).

**Message ID:** 951

#### Abbreviated ASCII Syntax:

```
RTKNETWORK mode [network#]
```

#### Factory Default:

```
RTKNETWORK AUTO
```

#### Input Example:

```
RTKNETWORK imax
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKNETWORK header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	<i>Table 59: Network RTK Mode</i> below		RTK network mode. The factory default is auto where the receiver switches to the first available network RTK source	Enum	4	H
3	network#	0 to 4294967295		Specify a number for the network (default = 0)	Ulong	4	H+4

**Table 59: Network RTK Mode**

Binary	ASCII	Description
0	DISABLE	Single reference station RTK mode. All received network RTK corrections are ignored.
1-4	Reserved	

Binary	ASCII	Description
5	VRS	<p>The Virtual Reference Station (VRS) or Virtual Base Station (VBS) idea introduced by Trimble, is that a base station is artificially created in the vicinity of a rover receiver. All baseline length dependent errors, such as abnormal troposphere variation, ionospheric disturbances and orbital errors, are reduced for this VRS. The rover receiving VRS information has a lower level of these errors than a distant base station. The VRS is calculated for a position, supplied by the rover during communication start up, with networking software. The VRS position can change if the rover is far away from the initial point. The format for sending the rover's position is standard NMEA format. Most rovers receive VRS data, for a calculated base station, within a couple of meters away.</p> <p>The VRS approach requires bi-directional communication for supplying the rover's position to the networking software.</p>
6	IMAX	<p>The iMAX idea, introduced by Leica Geosystems, is that networking software corrections, based on the rover's position, are calculated as with VRS. However, instead of calculating the base station observations for the provided position or another position closer to the base station, original observation information is corrected with the calculated corrections and broadcast. VRS works so that although the rover is unaware of the errors the VRS is taking care of, there still might be ionospheric remains in the base station observations. iMAX provides actual base station position information. The rover may assume the base station is at a distance and open its settings for estimation of the remaining ionospheric residuals. The iMAX method may trigger the rover to open its settings further than required, since the networking software removes at least part of the ionospheric disturbances. However, compared to VRS above, this approach is safer since it notifies the rover when there might be baseline length dependent errors in the observation information. iMAX requires bi-directional communication to the networking software for supplying the base station observation information.</p>
7	FKP	<p>The FKP method delivers the information from a base station network to the rover. No precise knowledge of the rover's position is required for providing the correct information. The corrections are deployed as gradients to be used for interpolating to the rover's actual position.</p>
8	MAX	<p>The basic principle of the master-auxiliary concept is to provide, in compact form, as much of the information from the network and the errors it is observing to the rover as possible. With more information about the state and distribution of the dispersive and non-dispersive errors across the network, the rover is able to use more intelligent algorithms in the determination of its position solution. Each supplier of reference station software will have their own proprietary algorithms for modeling or estimating these error sources. The rover system can decide to use or to neglect the network RTK information, depending on its own firmware algorithm performance.</p>
9	Reserved	
10	AUTO	<p>Default value, assume single base. If network RTK corrections are detected then the receiver will switch to the appropriate mode. iMAX and VRS can only be detected using RTCMV3, however, it is not possible to distinguish between iMAX or VRS. If iMAX or VRS is detected, then iMAX will be assumed.</p>

## 2.131 RTKPORTMODE

*Assigns the port for RTK and ALIGN messages*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command only applies to receivers with both RTK and ALIGN enabled.

A rover receiver with RTK and ALIGN enabled can receive RTK and ALIGN corrections at the same time. However, the two different sources (RTK and ALIGN) must be sent to different ports.

Use the RTKPORTMODE command to route correction feeds to different ports. RTK and ALIGN can be routed to any user specified ports.

Failing to specify the mode for the incoming source could cause unexpected behavior of RTK or ALIGN.

Ports configured using the RTKPORTMODE command must also be configured using the **INTERFACEMODE** command (see page 189).

**Message ID: 1936**

**Abbreviated ASCII Syntax:**

```
RTKPORTMODE [port] mode
```

**Factory Default:**

```
RTKPORTMODE COM1 RTK
RTKPORTMODE COM2 RTK
RTKPORTMODE COM3 RTK
RTKPORTMODE COM4 RTK
RTKPORTMODE COM5 RTK
RTKPORTMODE COM6 RTK
RTKPORTMODE ICOM1 RTK
RTKPORTMODE ICOM2 RTK
RTKPORTMODE ICOM3 RTK
RTKPORTMODE ICOM4 RTK
RTKPORTMODE ICOM5 RTK
RTKPORTMODE ICOM6 RTK
RTKPORTMODE ICOM7 RTK
RTKPORTMODE NCOM1 RTK
RTKPORTMODE NCOM2 RTK
RTKPORTMODE NCOM3 RTK
RTKPORTMODE USB1 RTK
```

```

RTKPORTMODE USB2 RTK
RTKPORTMODE USB3 RTK
RTKPORTMODE WCOM1 RTK
RTKPORTMODE BT1 RTK
RTKPORTMODE AUX RTK
RTKPORTMODE CCOM1 RTK
RTKPORTMODE CCOM2 RTK
RTKPORTMODE CCOM3 RTK
RTKPORTMODE CCOM4 RTK
RTKPORTMODE CCOM5 ALIGN
RTKPORTMODE CCOM6 RTK

```

**ASCII Example:**

```

RTKPORTMODE COM2 RTK
RTKPORTMODE COM3 ALIGN

```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKPORTMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Port	See <i>Table 32: Communications Port Identifiers</i> on page 136		Port identifier (default = THISPORT)	Enum	4	H
3	Mode	RTK	0	Mode for this port	Enum	4	H+4
		ALIGN	1				

## 2.132 RTKQUALITYLEVEL

### *Sets an RTK quality mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to select an RTK quality mode.

**Message ID:** 844

#### Abbreviated ASCII Syntax:

```
RTKQUALITYLEVEL mode
```

#### Factory Default:

```
RTKQUALITYLEVEL normal
```

#### ASCII Example:

```
RTKQUALITYLEVEL extra_safe
```

The **EXTRA\_SAFE** mode is needed in areas where the signal is partially blocked and the position solution in NORMAL mode shows NARROW\_INT even though the real position solution is out by several meters. Using EXTRA\_SAFE in these environments means the solution will be slower getting to NARROW\_INT but it is less likely to be erroneous.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKQUALITYLEVEL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	NORMAL	1	Set the RTK quality level mode to Normal RTK	Enum	4	H
		EXTRA_SAFE	4	Set the RTK quality level mode to Extra Safe RTK			

## 2.133 RTKRESET

### *Reset the RTK filter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command resets the RTK filter and causes the AdVanceRTK filter to undergo a complete reset, forcing the system to restart the ambiguity resolution calculations.

**Message ID:** 2082

**Abbreviated ASCII Syntax:**

```
RTKRESET [Switch]
```

**Example :**

```
RTKRESET
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Byte	Binary Offset
1	RTKRESET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Switch	FILTER	1	Reset the RTK filter. This is an optional parameter	Enum	4	H

## 2.134 RTKSOURCE

### *Sets the RTK correction source*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command determines what corrections the RTK filter can use. This is useful when the receiver is receiving corrections from multiple base stations.

**RTKSOURCE NONE** stops any corrections from being used and immediately disables RTK and RTK ASSIST.

**Message ID:** 494

#### Abbreviated ASCII Syntax:

```
RTKSOURCE type [id]
```

#### Factory Default:

```
RTKSOURCE AUTO ANY
```

#### ASCII Examples:

1. Use a specific format:

```
RTKSOURCE RTCMV3
```

2. Use a specific format and base station:

```
RTKSOURCE RTCMV3 1234
```

3. Disable RTK:

```
RTKSOURCE NONE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKSOURCE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	See <i>Table 60: RTK Source Type</i> below		Correction type	Enum	4	H
3	id	Char[4] or ANY		Base station ID (default = ANY)	Char[4]	8	H+4

**Table 60: RTK Source Type**

Binary	ASCII	Description
0	RTCM	Use only RTCM version 2 corrections from the given ID. ID: $0 \leq \text{RTCM ID} \leq 1023$ or ANY to accept all IDs

Binary	ASCII	Description
1	RTCA	Use only RTCA corrections from the given ID. ID: A four-character string containing only alpha (a-z) or numeric characters (0-9) <b>or</b> ANY to accept all IDs
2	CMR	Use only CMR corrections from the given ID. ID: $0 \leq \text{CMR ID} \leq 31$ <b>or</b> ANY to accept all IDs
10	AUTO	Use any correction type received. If multiple types are received, the first one received is used. If entered, the ID must be ANY.
11	NONE	Disable RTK
13	RTCMV3	Use only RTCM version 3 corrections from the given ID. ID: $0 \leq \text{RTCMV3 ID} \leq 4095$ <b>or</b> ANY to accept all IDs.
14	NOVATELX	Use only NovAtel proprietary corrections from the given ID. ID: A four-character string containing alpha (a-z) or numeric characters (0-9) <b>or</b> ANY to accept all IDs.

## 2.135 RTKSOURCETIMEOUT

### Sets RTK correction source timeout

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

When multiple RTK correction sources are available, this command allows the user to set a time, in seconds, that the receiver will wait before switching to another RTK correction source if corrections from the original source are lost.

**Message ID:** 1445

#### Abbreviated ASCII Syntax:

```
RTKSOURCETIMEOUT option [timeout]
```

#### Factory Default:

```
RTKSOURCETIMEOUT AUTO
```

#### ASCII Example:

```
RTKSOURCETIMEOUT auto
RTKSOURCETIMEOUT set 180
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKSOURCE TIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	AUTO	1	Sets the timeout according to network type or other self-detected conditions. Timeout field is optional for AUTO and has no effect	Enum	4	H
		SET	2	Sets the timeout to the value entered in the <i>timeout</i> field.			
3	timeout	1 to 3600 s (maximum)		Specify the time 0 is not accepted if <i>SET</i> is entered in the <i>option</i> field (default=0 for the AUTO option)	Ulong	4	H+4

## 2.136 RTKSVENTRIES

### *Sets number of satellites in corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets the number of satellites (at the highest elevation) that are transmitted in the RTK corrections from a base station receiver. This is useful when the amount of bandwidth available for transmitting corrections is limited.

**Message ID:** 92

**Abbreviated ASCII Syntax:**

```
RTKSVENTRIES number
```

**Factory Default:**

```
RTKSVENTRIES 24
```

**ASCII Example:**

```
RTKSVENTRIES 7
```

GPS devices have enabled many transit and fleet authorities to provide Automatic Vehicle Location (AVL). AVL systems track the position of individual vehicles and relay that data back to a remote dispatch location that can store or better utilize the information. Consider the implementation of an AVL system within a police department, to automatically log and keep track of the location of each cruiser. Typically a fleet uses a 9600 bps connection where AVL data is relayed back to headquarters. The limited bandwidth of the radio must be shared amongst the AVL and other systems in multiple cruisers.

When operating with a low baud rate radio transmitter (9600 or lower), especially over a long distance, the AVL system could limit the number of satellites for which corrections are sent using the **RTKSVENTRIES** command.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKSVENTRIES header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	number	4-24		The number of SVs to be transmitted in correction messages	Ulong	4	H

## 2.137 RTKTIMEOUT

### *Sets maximum age of RTK data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command is used to set the maximum age of RTK data to use when operating as a rover station. RTK data received that is older than the specified time is ignored.

When RTK ASSIST is active, the **RTKTIMEOUT** command is disregarded. The maximum time that RTK will continue past an RTK corrections outage is controlled by the settings in the **RTKASSISTTIMEOUT** command (see page 286).

**Message ID:** 910

**Abbreviated ASCII Syntax:**

```
RTKTIMEOUT delay
```

**Factory Default:**

```
RTKTIMEOUT 60
```

**ASCII Example (rover):**

```
RTKTIMEOUT 20
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	delay	5 to 60 s		Maximum RTK data age	Ulong	4	H

## 2.138 RTKTRACKINGCONTROL

### ***Automatic selection of tracking signal type based on incoming base station observations***

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Controls automatic selection of tracking signal type based on incoming base station observations. This command only applies to single GPS/GLO L2 channel configurations that can auto switch between L2P and L2C. The **RTKTRACKINGCONTROL** command setting takes precedence over the **FORCEGPSL2CODE** command (see page 166) and **FORCEGLOL2CODE** command (see page 164). If this command is set to AUTO, the receiver will always match signal types to incoming corrections.

**Message ID:** 1351

**Abbreviated ASCII Syntax:**

```
RTKTRACKINGCONTROL [Mode]
```

**Factory Default:**

```
RTKTRACKINGCONTROL AUTO
```

**ASCII Example:**

```
RTKTRACKINGCONTROL DISABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	RTKTRACKINGCONTROL header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	Mode	Disable	0	Disable automatic selection of tracking signal	Enum	4	H
		Auto	1	Automatically match the signal type to the incoming corrections. Default = Auto			

## 2.139 SAVECONFIG

### *Save current configuration in NVM*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

**SAVECONFIG** saves commands that were entered by a user to establish the desired receiver configuration on start up. This configuration is saved in Non-Volatile Memory (NVM) and is executed every time the receiver starts, whether by power-up or the **RESET** command on page 281. The commands that are saved as part of a configuration are typically **LOG** requests, **SERIALCONFIG** commands, **ICOMCONFIG** commands, a **FIX** command and others. Note that not all the commands can be saved using **SAVECONFIG**. All of the commands that set a configuration, including default commands for the receiver, are listed in the **RXCONFIG** log (see page 775). To clear the commands saved by **SAVECONFIG** and reset the receiver to the factory-set configuration, the **FRESET** command on page 171 can be used.

If using the **SAVECONFIG** command in NovAtel Connect, ensure that you have all windows other than the Console window closed. Otherwise, log requests used for the various windows are saved as well. This will result in unnecessary data being logged.

**Message ID: 19**

**Abbreviated ASCII Syntax:**

SAVECONFIG

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SAVECONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

## 2.140 SAVEETHERNETDATA

### *Save the configuration data associated with an Ethernet interface*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

Saving the configuration data for an Ethernet interface allows the interface to start automatically at boot time and be configured with either a static IP address or to obtain an address using DHCP. The **SAVEETHERNETDATA** command saves the configuration for the interface previously entered using the **ETHCONFIG** command (see page 142), **IPCONFIG** command (see page 195) and **DNSCONFIG** command (see page 129). The configuration data that is saved will survive a **RESET** command (see page 281) and **FRESET** command (see page 171). To clear the Ethernet interface configuration data, the **FRESET ETHERNET** command is used. It is not necessary to issue the **SAVECONFIG** command (see page 302) to save the Ethernet interface configuration data. In fact, if **SAVECONFIG** is used to save the **ETHCONFIG**, **IPCONFIG** and **DNSCONFIG** commands, the configuration saved by **SAVEETHERNETDATA** will take precedence over the **SAVECONFIG** configuration.

**Message ID:** 1679

#### Abbreviated ASCII Syntax:

```
SAVEETHERNETDATA [Interface]
```

#### ASCII Example:

```
ETHCONFIG ETHA AUTO AUTO AUTO AUTO
IPCONFIG ETHA STATIC 192.168.8.11 255.255.255.0 192.168.8.1
DNSCONFIG 1 192.168.4.200
SAVEETHERNETDATA ETHA
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SAVEETHERNET DATA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Interface	ETHA	2	The Ethernet interface to save the configuration data for. The default is ETHA.	Enum	4	H

Note that the configurations set using the **ICOMCONFIG** command (see page 187) and **NTRIPCONFIG** command (see page 241) are not saved by the **SAVEETHERNETDATA** command. The following factory default ICOM configurations can be used if Ethernet access to the receiver is required immediately after the receiver is **RESET** or **FRESET**.

```
ICOMCONFIG ICOM1 TCP :3001
ICOMCONFIG ICOM2 TCP :3002
ICOMCONFIG ICOM3 TCP :3003
ICOMCONFIG ICOM4 TCP :3004
ICOMCONFIG ICOM5 TCP :3005
ICOMCONFIG ICOM6 TCP :3006
ICOMCONFIG ICOM7 TCP :3007
```

See also the following commands:

- **ETHCONFIG** command on page 142
- **IPCONFIG** command on page 195
- **DNSCONFIG** command on page 129
- **FRESET** command on page 171

## 2.141 SBASCONTROL

### Sets SBAS test mode and PRN

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to dictate how the receiver tracks and uses correction data from Satellite Based Augmentation Systems (SBAS).

To enable the position solution corrections, issue the **SBASCONTROL ENABLE** command. The receiver does not, by default, attempt to track or use any SBAS signals satellites unless told to do so by the **SBASCONTROL** command. When in AUTO mode, if the receiver is outside the defined satellite system's corrections grid, it reverts to ANY mode and chooses a system based on other criteria.

The "testmode" parameter in the example provides a method to use a particular satellite even if it is currently operating in test mode. The recommended setting for tracking satellites operating in test mode is ZEROTOTWO. On a simulator, you may want to leave this parameter off or specify NONE explicitly.

When using the **SBASCONTROL** command to direct the receiver to use a specific correction type, the receiver begins to search for and track the relevant GEO PRNs for that correction type only.

The receiver can be forced to track a specific PRN using the **ASSIGN** command (see page 70). The receiver can also be forced to use the corrections from a specific SBAS PRN using the **SBASCONTROL** command.

Disable stops the corrections from being used.

**Message ID: 652**

#### Abbreviated ASCII Syntax:

```
SBASCONTROL switch [system] [prn] [testmode]
```

#### Factory Default:

```
SBASCONTROL disable
```

#### ASCII Example:

```
SBASCONTROL enable waas
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SBASCONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Receiver does not use the SBAS corrections it receives (default)	Enum	4	H
		ENABLE	1	Receiver uses the SBAS corrections it receives			
3	system	See <i>Table 61: System Types</i> on the next page		Choose the SBAS the receiver will use	Enum	4	H+4

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	prn	0		Receiver uses any PRN (default)	Ulong	4	H+8
		120-158 and 183-187		Receiver uses SBAS corrections only from this PRN			
5	testmode	NONE	0	Receiver interprets Type 0 messages as they are intended (as do not use) (default)	Enum	4	H+12
		ZEROTOTWO	1	Receiver interprets Type 0 messages as Type 2 messages			
		IGNOREZERO	2	Receiver ignores the usual interpretation of Type 0 messages (as do not use) and continues			

Table 61: System Types

ASCII	Binary	Description
NONE	0	Does not use any SBAS satellites (Default for SBASCONTROL DISABLE)
AUTO	1	Automatically determines satellite system to use and prevents the receiver from using satellites outside of the service area (Default for SBASCONTROL ENABLE)
ANY	2	Uses any and all SBAS satellites found
WAAS	3	Uses only WAAS satellites
EGNOS	4	Uses only EGNOS satellites
MSAS	5	Uses only MSAS satellites
GAGAN	6	Uses only GAGAN satellites
QZSS	7	Uses only QZSS L1S signals

## 2.142 SBASECUTOFF

### Sets SBAS satellite elevation cut-off

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command sets the elevation cut-off angle for tracked SBAS satellites. The receiver does not start automatically searching for an SBAS satellite until it rises above the cut-off angle (when satellite position is known). Tracked SBAS satellites that fall below the cut-off angle are no longer tracked unless they are manually assigned (see the **ASSIGN** command on page 70).

This command permits a negative cut-off angle and can be used in the following situations:

- The antenna is at a high altitude and can look below the local horizon
- Satellites are visible below the horizon due to atmospheric refraction

Use the **ELEVATIONCUTOFF** command (see page 140) to set the cut-off angle for any system.

**Message ID:** 1000

**Abbreviated ASCII Syntax:**

```
SBASECUTOFF angle
```

**Factory Default:**

```
SBASECUTOFF -5.0
```

**ASCII Example:**

```
SBASECUTOFF 10.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SBASECUTOFF header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	angle	±90.0 degrees		Elevation cut-off angle relative to horizon	Float	4	H

## 2.143 SBASTIMEOUT

### *Sets the SBAS position time out*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to set the amount of time the receiver remains in an SBAS position if it stops receiving SBAS corrections.

**Message ID:** 1001

#### **Abbreviated ASCII Syntax:**

```
SBASTIMEOUT mode [delay]
```

#### **Factory Default:**

```
SBASTIMEOUT auto
```

#### **ASCII Example:**

```
SBASTIMEOUT set 100
```

When the time out mode is AUTO, the time out delay is 180 s.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SBASTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	See Table 62: SBAS Time Out Mode below		Time out mode	Enum	4	H
3	delay	2 to 1000 s		Maximum SBAS position age (default=180)	Double	8	H+4
4	Reserved				Double	8	H+12

**Table 62: SBAS Time Out Mode**

Binary	ASCII	Description
0	Reserved	
1	AUTO	Set the default value (180 s)
2	SET	Set the delay in seconds

## 2.144 SELECTCHANCONFIG

### *Sets the channel configuration*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Some software models come with support for more than one channel configuration, which can be verified by logging **CHANCONFIGLIST** log (see page 451). The **SELECTCHANCONFIG** command is used to pick a different channel configuration. If a different channel configuration is selected via the **SELECTCHANCONFIG** command, the receiver resets and starts up with the new configuration. The Set in Use number in the **CHANCONFIGLIST** log (see page 451) changes as a result.

After a FRESET, the channel configuration is reset to the factory default value. For receivers with a positioning model bit of R, B or P, the default channel configuration is 3. For all other positioning models, the default is 1.

**Message ID:** 1149

#### Abbreviated ASCII Syntax:

```
SELECTCHANCONFIG chanconfigsetting
```

#### Factory Default:

```
SELECTCHANCONFIG 3 (if the positioning model bit is R, B or P)
```

```
SELECTCHANCONFIG 1 (for all other positioning models)
```

#### ASCII Example:

```
SELECTCHANCONFIG 2
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SELECTCHANCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	chanconfigsetting	1 to n where n is the number of channel configurations in the <b>CHANCONFIGLIST</b> log (see page 451)		Channel configuration to use	Ulong	4	H

Below is a use case example of the **SELECTCHANCONFIG** command. Abbreviated ASCII commands and logs are used to better illustrate the example.

1. LOG CHANCONFIGLIST to show what the channel configuration options are and which channel configuration set is being used.

```

```

2. There are nine options given for the model and the fifth channel configuration set is currently being used.
3. If the user would like to use the third channel configuration set enter, **SELECTCHANCONFIG 3** command.
4. The receiver receives the command and resets. At startup, the third channel configuration set is configured.
5. To verify that setting has changed, enter LOG CHANCONFIGLIST.

6. This log shows that the third set is selected. To further verify, enter **LOG TRACKSTAT** to show all the configured channels.

## 2.145 SEND

### *Sends an ASCII message to a COM port*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to send ASCII printable data from any of the COM or USB ports to a specified communications port. This is a one time command, therefore the data message must be preceded by the **SEND** command and followed by <CR> each time data is sent. If the data string contains delimiters (that is, spaces, commas, tabs and so on), the entire string must be contained within double quotation marks. Carriage return and line feed characters (for example, 0x0D, 0x0A) are appended to the sent ASCII data.

**Message ID:** 177

#### **Abbreviated ASCII Syntax:**

```
SEND [port] data
```

#### **ASCII Example**

```
SEND com1 "log com1 rtcaobs ontime 5"
```

**Scenario:** Assume you are operating receivers as base and rover stations. It could also be assumed that the base station is unattended but operational and you wish to control it from the rover station. From the rover station, you could establish the data link and command the base station receiver to send differential corrections.

**Figure 9: Using the SEND Command**

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SEND header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 4: Detailed Port Identifier</i> on page 36		Output port (default=THISPORT)	Enum	4	H
3	message	Max 100 character string (99 typed visible chars and a null char added by the firmware automatically)		ASCII data to send	String [max 100]	Variable <sup>1</sup>	H+4

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.146 SENDHEX

### *Send non-printable characters in hex pairs*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is like the **SEND** command (see page 314) except it is used to send non-printable characters expressed as hexadecimal pairs. Carriage return and line feed characters (for example, 0x0D, 0x0A) will not be appended to the sent data and so must be explicitly added to the data if needed.

**Message ID:** 178

#### Abbreviated ASCII Syntax:

```
SENDHEX [port] length data
```

#### Input Example:

```
SENDHEX COM1 6 143Ab5910D0A
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SENDHEX header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 4: Detailed Port Identifier</i> on page 36		Output port (default=THISPORT)	Enum	4	H
3	length	0 - 700		Number of hex pairs	Ulong	4	H+4
4	message	limited to a 700 maximum string (1400 pair hex). Even number of ASCII characters from set of 0-9, A-F. No spaces are allowed between pairs of characters		Data	String [max 700]	Variable <sup>1</sup>	H+8

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.147 SERIALCONFIG

### *Configures serial port settings*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to configure the receiver's asynchronous serial port communications drivers.

1. Also refer to the **ECHO** command on page 135.
2. The **SERIALCONFIG** command can be used as a log to confirm settings.
3. The entire content of the current log is sent before pausing due to the receipt of the XOFF character.

The current SERIALCONFIG port configuration can be reset to its default state by sending it two hardware break signals of 250 milliseconds each, spaced by fifteen hundred milliseconds (1.5 seconds) with a pause of at least 250 milliseconds following the second break. This will:

- Stop the logging of data on the current port (see the **UNLOGALL** command on page 376)
- Clear the transmit and receive buffers on the current port
- Return the current port to its default settings (see *Command Defaults* on page 55 for details)
- Set the interface mode to NovAtel for both input and output (see the **INTERFACEMODE** command on page 189)

This break detection can be disabled using the **SERIALCONFIG** command.

1. The **COMCONTROL** command (see page 110) may conflict with handshaking of the selected COM port. If handshaking is enabled, then unexpected results may occur.
2. Baud rates higher than 115,200 bps are not supported by standard PC hardware. Special PC hardware may be required for higher rates, including 230400 bps and 460800 bps. Avoid having COM ports of two receivers connected together using baud rates that do not match. Data transmitted through a port operating at a slower baud rate may be misinterpreted as break signals by the receiving port if it is operating at a higher baud rate because data transmitted at the lower baud rate is stretched relative to the higher baud rate. In this case, configure the receiving port to break detection disabled using the **SERIALCONFIG** command.

Use the **SERIALCONFIG** command before using the **INTERFACEMODE** command on each port. Turn break detection off using the **SERIALCONFIG** command to stop the port from resetting because it is interpreting incoming bits as a break command.

**Message ID: 1246**

#### **Abbreviated ASCII Syntax:**

```
SERIALCONFIG [port] baud [parity[databits[stopbits[handshaking[break]]]]]
```

#### **Factory Defaults:**

```
SERIALCONFIG COM1 9600 N 8 1 N ON
SERIALCONFIG COM2 9600 N 8 1 N ON
SERIALCONFIG COM3 9600 N 8 1 N ON
```

```
SERIALCONFIG COM4 9600 N 8 1 N ON
SERIALCONFIG COM5 9600 N 8 1 N ON
```

**ASCII Example:**

```
SERIALCONFIG com1 9600 n 8 1 n off
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SERIALCONFIG Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 63: COM Port Identifiers</i> below		Port to configure (default = THISPORT)	Enum	4	H
3	bps/ baud	2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400 and 460800		Communication baud rate (bps).	Ulong	4	H+4
4	parity	See <i>Table 64: Parity</i> on the next page		Parity	Enum	4	H+8
5	databits	7 or 8		Number of data bits (default = 8)	Ulong	4	H+12
6	stopbits	1 or 2		Number of stop bits (default = 1)	Ulong	4	H+16
7	handshake <sup>1</sup>	See <i>Table 65: Handshaking</i> on the next page		Handshaking	Enum	4	H+20
8	break	OFF	0	Disable break detection	Enum	4	H+24
		ON	1	Enable break detection (default)			

**Table 63: COM Port Identifiers**

Binary	ASCII	Description	Applicable Receiver
1	COM1	COM port 1	OEM719, OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7
2	COM2	COM port 2	OEM719, OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7
3	COM3	COM port 3	OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SMART7

<sup>1</sup>The OEM719, SPAN CPT7 and SMART7 do not support hardware handshaking. Only transmit and receive lines exist for the OEM719, SPAN CPT7 and SMART7 ports.

Binary	ASCII	Description	Applicable Receiver
6	THISPORT	The current COM port	OEM719, OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7
19	COM4	COM port 4	OEM7700, OEM7600, OEM7720
21	IMU	IMU COM port	dependent on hardware configuration
31	COM5	COM port 5	OEM7700, OEM7600, OEM7720
32	COM6	COM port 6	
33	BT1	Bluetooth COM port	dependent on hardware configuration
34	COM7	COM port 7	
35	COM8	COM port 8	
36	COM9	COM port 9	
37	COM10	COM port 10	

Table 64: Parity

Binary	ASCII	Description
0	N	No parity (default)
1	E	Even parity
2	O	Odd parity

Table 65: Handshaking

Binary	ASCII	Description
0	N	No handshaking (default)
1	XON	XON/XOFF software handshaking
2	CTS	CTS/RTS hardware handshaking

## 2.148 SERIALPROTOCOL

**Sets the protocol to be used by a serial port**

**Platform:** OEM729, PwrPak7

On some OEM7 receiver cards, selected ports can support either RS-232 or RS-422 signaling protocol. The default protocol is RS-232. The **SERIALPROTOCOL** command is used to select the protocol (RS-232 or RS-422) supported on the port.

RS-422/RS-232 selection is available only on COM1 of the OEM729 or COM1 and COM2 on the PwrPak7.

**Message ID:** 1444

**Abbreviated ASCII Syntax:**

```
SERIALPROTOCOL port protocol
```

**ASCII Example:**

```
SERIALPROTOCOL COM1 RS422
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SERIAL PROTOCOL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 66: Ports Supporting RS-422</i> below		Select the COM port on which the protocol is being set. The port that can be entered depends on the hardware platform being used.	Enum	4	H
3	protocol	RS232	0	Set the port to use RS-232 protocol	Enum	4	H+4
		RS422	1	Set the port to use RS-422 protocol			

After switching a COM port from RS-232 to RS-422, send a carriage return (CR) on the newly configured port to flush the buffer prior to sending new commands on the port.

**Table 66: Ports Supporting RS-422**

OEM7 Receiver Type	Allowable Ports	Binary Value
OEM719	None	
OEM729	COM1	1

OEM7 Receiver Type	Allowable Ports	Binary Value
OEM7600	None	
OEM7700	None	
OEM7720	None	
PwrPak7	COM1	1
	COM2	2

## 2.149 SETADMINPASSWORD

### *Sets the administration password*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This command sets the administration password used to log into various web services.

- The administration password is required for Secure ICOM access.

The default admin password is the receiver PSN. For OEM7 enclosures, such as the PwrPak7, the default password is the enclosure PSN. The enclosure PSN is shown on the label on the bottom of the enclosure and in the ENCLOSURE line in the **VERSION** log (see page 873). The default password should be changed before connecting the receiver to a network.

**Message ID:** 1579

#### Abbreviated ASCII Syntax:

```
SETADMINPASSWORD oldpassword newpassword
```

#### Input example

```
SETADMINPASSWORD ABC123 XYZ789
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETADMIN PASSWORD header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	OldPassword	Maximum 28 character string		Previous password.	String [28]	variable <sup>1</sup>	H
3	NewPassword	Maximum 28 character string		New password.	String [28]	variable <sup>1</sup>	variable

This password can be restored to default (the receiver PSN) by issuing the **FRESET USER\_ACCOUNTS** command (see *FRESET* on page 171).

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.150 SETAPPROXPOS

### *Sets an approximate position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command sets an approximate latitude, longitude and height in the receiver. Estimating these parameters, when used in conjunction with an approximate time (see the **SETAPPROXTIME** command on the next page), can improve satellite acquisition times and Time To First Fix (TTFF). For more information about TTFF and Satellite Acquisition, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

The horizontal position entered should be within 200 km of the actual receiver position. The approximate height is not critical and can normally be entered as zero. By default, if the receiver cannot calculate a valid position within 2.5 minutes of entering an approximate position, the approximate position is ignored.

The approximate position is not visible in any position logs. It can be seen by issuing a SETAPPROXPOS log.

**Message ID: 377**

#### Abbreviated ASCII Syntax:

```
SETAPPROXPOS lat lon height
```

#### Input Example:

```
SETAPPROXPOS 51.116 -114.038 0
```

For an example on the use of this command, refer to the **SETAPPROXTIME** command on the next page.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETAPPROXPOS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Lat	± 90 degrees		Approximate latitude	Double	8	H
3	Lon	± 180 degrees		Approximate longitude	Double	8	H+8
4	Height	-1000 to +20000000 m		Approximate height	Double	8	H+16

## 2.151 SETAPPROXTIME

### *Sets an approximate GPS reference time*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command sets an approximate time in the receiver. The receiver uses this time as system time until a coarse time can be acquired. This can be used in conjunction with an approximate position (see the **SETAPPROXPOS** command on the previous page) to improve Time To First Fix (TTFF). For more information TTFF and Satellite Acquisition, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

The time entered should be within 10 minutes of the actual GPS reference time. If the week number entered does not match the broadcast week number, the receiver resets once it is tracking.

**Message ID:** 102

**Abbreviated ASCII Syntax:**

```
SETAPPROXTIME week sec
```

**Input Example:**

```
SETAPPROXTIME 1930 501232
```

Upon power up, the receiver does not know its position or time and therefore cannot use almanac information to aid satellite acquisition. You can set an approximate GPS reference time using the **SETAPPROXPOS** command (see page 323).

Approximate time and position may be used in conjunction with a current almanac to aid satellite acquisition. See the table below for a summary of the OEM7 family commands used to inject an approximated time or position into the receiver:

Approximate	Command
Time	SETAPPROXTIME
Position	SETAPPROXPOS

Base station aiding can help in these environments. A set of ephemerides can be injected into a rover station by broadcasting the RTCAEPHEM message from a base station. This is also useful in environments where there is frequent loss of lock. GPS ephemeris is three frames long within a sequence of five frames. Each frame requires 6 s of continuous lock to collect the ephemeris data. This gives a minimum of 18 s and a maximum of 36 s continuous lock time or when no recent ephemerides (new or stored) are available.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETAPPROXTIME header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	week	0-9999		GPS reference week number	Ulong	4	H
3	sec	0-604800		Number of seconds into GPS reference week	Double	8	H+4

## 2.152 SETBASERECEIVERTYPE

### *Sets base receiver type*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command allows the user to specify the base receiver type to aid GLONASS ambiguity fixing in RTK. It can be used as a substitute for RTCM1033 messages that contains the information on the base receiver type. This command should be issued to the Rover.

An incorrect base type setting can significantly impair ambiguity resolution.

**Message ID:** 1374

#### Abbreviated ASCII Syntax:

```
SETBASERECEIVERTYPE base_type
```

#### Factory Default:

```
SETBASERECEIVERTYPE unknown
```

#### ASCII Example:

```
SETBASERECEIVERTYPE novatel
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETBASERECEIVER TYPE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	base_type	unknown	0	Unknown Base	Enum	4	H
		novatel	1	NovAtel Base			
		trimble	2	Trimble Base			
		topcon	3	Topcon Base			
		magellan	4	Magellan Base			
		leica	5	Leica Base			

## 2.153 SETBESTPOSCRITERIA

### Sets selection criteria for BESTPOS

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to set the criteria for the **BESTPOS** log (see page 429) and choose between 2D and 3D standard deviation to obtain the best position from the **BESTPOS** log (see page 429). It also allows you to specify the number of seconds to wait before changing the position type. This delay provides a single transition that ensures position types do not skip back and forth.

The **SETBESTPOSCRITERIA** command is also used as the basis for the **UALCONTROL** command (see page 364) standard deviations.

**Message ID:** 839

#### Abbreviated ASCII Syntax:

```
SETBESTPOSCRITERIA type [delay]
```

#### Factory Default:

```
SETBESTPOSCRITERIA pos3d 0
```

#### Input Example:

```
SETBESTPOSCRITERIA pos2d 5
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETBESTPOS CRITERIA header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	See <i>Table 67: Selection Type</i> below		Select a 2D or 3D standard deviation type to obtain the best position from the BESTPOS log	Enum	4	H
3	delay	0 to 100 s		Set the number of seconds to wait before changing the position type. Default=0	Ulong	4	H+4

**Table 67: Selection Type**

ASCII	Binary	Description
POS3D	0	3D standard deviation
POS2D	1	2D standard deviation

## 2.154 SETDIFFCODEBIASES

### *Sets satellite differential code biases*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Changing the biases may negatively affect positioning accuracy. NovAtel recommends that only advanced users modify the biases.

Use this command to set the differential code biases that correct pseudorange errors affecting the L1/L2 ionospheric corrections. Bias values are restricted to between -10 ns and +10 ns. A set of biases is included in the firmware and use of the biases is enabled by default.

The receiver uses the C/A code on L1 and the P code on L2 to calculate a dual-frequency ionospheric correction. However, the GNSS clock corrections are broadcast as if the P codes on both L1 and L2 are used to calculate this correction. The biases account for the differences between the P and C/A codes on L1 and improve the estimate of the ionospheric correction.

The biases are calculated by the International GNSS Service (IGS). Calculation details, analysis and results are available at <http://aiuws.unibe.ch/spec/dcb.php>. The most recent 30 day average bias values can be downloaded from [http://ftp.aiub.unibe.ch/CODE/CODE\\_FULL.DCB](http://ftp.aiub.unibe.ch/CODE/CODE_FULL.DCB).

**Message ID: 687**

#### **Abbreviated ASCII Syntax:**

```
SETDIFFCODEBIASES bias_type biases
```

#### **ASCII Example:**

```
<SETDIFFCODEBIASES COM1 2 91.0 UNKNOWN 0 0.470 02440020 365b 32768

## 2.155 SETIONOTYPE

### *Enables ionospheric models*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to set which ionospheric corrections model the receiver should use. If the selected model is not available, the receiver reverts to AUTO.

L1 only models automatically use SBAS ionospheric grid corrections, if available.

**Message ID:** 711

**Abbreviated ASCII Syntax:**

```
SETIONOTYPE model
```

**Factory Default:**

```
SETIONOTYPE auto
```

**ASCII Example:**

```
SETIONOTYPE Klobuchar
```

An ionotype of AUTO is recommended for PDP and GLIDE.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETIONOTYPE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	model	See Table 68: <i>Ionospheric Correction Models</i> below		Choose an ionospheric corrections model	Enum	4	H

**Table 68: Ionospheric Correction Models**

ASCII	Binary	Description
NONE	0	Don't use ionosphere modeling
KLOBUCHAR	1	Use the Klobuchar model broadcast by GPS
GRID	2	Use the SBAS grid model
L1L2	3	Multi-frequency computed
AUTO	4	Automatically determine the ionospheric model to use

## 2.156 SETNAV

### *Sets start and destination waypoints*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command permits entry of one set of navigation waypoints (see *Figure 10: Illustration of SETNAV Parameters* below). The origin (from) and destination (to) waypoint coordinates entered are considered on the ellipsoidal surface of the current datum (default wgs84). Once **SETNAV** has been set, monitor the navigation calculations and progress by observing messages in the **NAVIGATE** log (see page 628).

Track offset is the perpendicular distance from the great circle line drawn between the from lat-lon and to lat-lon waypoints. It establishes the desired navigation path or track, that runs parallel to the great circle line, which now becomes the offset track, and is set by entering the track offset value in meters. A negative track offset value indicates that the offset track is to the left of the great circle line track. A positive track offset value (no sign required) indicates the offset track is to the right of the great circle line track (looking from origin to destination). See *Figure 10: Illustration of SETNAV Parameters* below for clarification.

**Message ID:** 162

#### **Abbreviated ASCII Syntax:**

```
SETNAV fromlat fromlon tolat tolon trackoffset from-point to-point
```

#### **Factory Default:**

```
SETNAV 90.0 0.0 90.0 0.0 0.0 from to
```

#### **ASCII Example:**

```
SETNAV 51.1516 -114.16263 51.16263 -114.1516 -125.23 FROM TO
```

**Figure 10: Illustration of SETNAV Parameters**

Consider the case of setting waypoints in a deformation survey along a dam. The surveyor enters the From and To point locations, on either side of the dam using the **SETNAV** command. They then use the **NAVIGATE** log messages to record progress and show where they are in relation to the From and To points.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETNAV header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	fromlat	± 90 degrees		Origin latitude in units of degrees/decimal degrees. A negative sign for South latitude. No sign for North latitude	Double	8	H
3	fromlon	± 180 degrees		Origin longitude in units of degrees/decimal degrees. A negative sign for West longitude. No sign for East longitude	Double	8	H+8
4	tolat	± 90 degrees		Destination latitude in units of degrees/decimal degrees	Double	8	H+16
5	tolon	± 180 degrees		Destination longitude in units of degrees/decimal degrees	Double	8	H+24
6	trackoffset	± 1000 km		Waypoint great circle line offset (in meters) establishes offset track. Positive indicates right of great circle line and negative indicates left of great circle line	Double	8	H+32
7	from-point	5 characters maximum		ASCII origin station name	String [max 5]	Variable 1	H+40
8	to-point	5 characters maximum		ASCII destination station name	String [max 5]	Variable 1	Variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.157 SETROVERID

### Set ID for ALIGN rovers

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command sets the Rover ID output in the **ROVERPOS** log (see page 751), **HEADING2** log (see page 553), **ALIGNBSLNXYZ** log (see page 403) and **ALIGNBSLNENU** log (see page 401).

The default value for the ID is set using the last six characters of the receiver PSN Number. For example, if the receiver PSN number is DAB07170027, ID is set as R027, i.e., 17 is represented as R and last three characters are filled in as is. The fourth last character is ignored.

It is not guaranteed that each receiver will have a unique auto-generated ID. Use this command to set the ID in case the auto-generated ID overlaps with other rovers. It is the user's responsibility to ensure each receiver ID is unique (if they own multiple receivers). If the ID overlaps, use this command to set the ID.

**Message ID:** 1135

#### Abbreviated ASCII Syntax:

```
SETROVERID rovid
```

#### Factory Default:

If the receiver PSN is: DAB07170027

```
SETROVERID R027
```

#### Input Example

```
SETROVERID rov1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETROVERID header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	ID	4 Character String e.g., ROV1		ID String (maximum 4 characters plus NULL)	String [5]	5 <sup>1</sup>	H

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.158 SETTIMEBASE

### *Sets primary and backup systems for time base*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command configures the primary and backup steering system(s) for timing. The primary system is the system that the receiver steers the clock to. Upon startup, the primary system must be present long enough to steer the clock to be valid once, otherwise, the backup system cannot be used. The backup system is used whenever the primary system is not present.

**Message ID:** 1237

#### Abbreviated ASCII Syntax:

```
SETTIMEBASE primarysystem numbackups[system[timeout]]
```

#### Factory Default:

For GLONASS only receiver:

```
SETTIMEBASE glonass 0
```

For GPS capable receiver:

```
SETTIMEBASE gps 1 auto 0
```

For BeiDou only receiver:

```
SETTIMEBASE beidou 0
```

#### Input Example:

```
SETTIMEBASE gps 1 glonass 30
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETTIMEBASE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	primarysystem	<i>Table 69: System Used for Timing on the next page</i>		The primary system for steering the receiver clock	Enum	4	H
3	numbackups	0 or 4		The number of records to follow. <b>Note:</b> When more than one backup system is specified, the backup systems are selected according to numeric order.	Ulong	4	H+4
4	system <sup>1</sup>	<i>Table 69: System Used for Timing below</i>		The system to be used for backup	Enum	4	H+8

<sup>1</sup>The *system* and *timeout* fields can repeat.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	timeout <sup>1</sup>	0 to +4294967295 (seconds)		Duration that the backup system is used to steer the clock. 0 means ongoing	Ulong	4	H+12

Table 69: System Used for Timing

Binary	ASCII
0	GPS <sup>1</sup>
1	GLONASS
2	GALILEO
3	BEIDOU
4	NAVIC
99	AUTO <sup>2</sup>

<sup>1</sup>GPS setting includes QZSS satellites.

<sup>2</sup>AUTO is used only as a backup system (not available for primary system field).

## 2.159 SETTROPOMODEL

### *Sets Troposphere model*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command sets the troposphere model used to correct ranges used in the PSRPOS and PDPPOS solutions.

**Message ID:** 1434

**Abbreviated ASCII Syntax:**

```
SETTROPOMODEL model
```

**Factory Default:**

```
SETTROPOMODEL auto
```

**Input Example:**

```
SETTROPOMODEL none
```

Disabling the troposphere model may negatively affect positioning accuracy. NovAtel recommends that only advanced users modify this setting.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETTROPOMODEL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	model	NONE	1	Do not apply any troposphere corrections	Enum	4	H
		AUTO	2	Automatically use an appropriate model			

## 2.160 SETUTCLEAPSECONDS

### *Sets future leap seconds*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command allows the user to force the UTC offset to be updated according to the input date.

Leap seconds will occur at the end of the UTC day specified. The receiver will use the leap second set by this command until a leap second can be obtained over the air.

**Message ID: 1150**

#### **Abbreviated ASCII Syntax:**

```
SETUTCLEAPSECONDS seconds [futureweeknumber [futuredaynumber
[futureseconds]]]
```

#### **Input Example:**

```
SETUTCLEAPSECONDS 18 1929 7 18
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETUTCLEAPSECONDS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Seconds <sup>1</sup>	0 – 4294967295		Current UTC leap second	Ulong	4	H
3	Futureweek number	0 – 10000		GPS Week when future leap seconds will take effect	Ulong	4	H+4
4	Futureday number	1 – 7		Day of the week when future leap seconds will take effect	Ulong	4	H+8
5	Futureseconds	0 – 4294967295		Future leap second offset that will take effect at the end of the futuredaynumber of the futureweeknumber	Ulong	4	H+12

<sup>1</sup>This value will only be applied if the UTC status in the TIME log is not Valid.

## 2.161 SOFTLOADCOMMIT

### *Completes the SoftLoad process*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command completes the SoftLoad process by verifying the downloaded image and activating it. Refer to Updating Using SoftLoad Commands in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more information about the SoftLoad process.

This command can only be sent to the receiver when the **SOFTLOADSTATUS** log (see page 841) reports READY\_FOR\_DATA.

After issuing the **SOFTLOADCOMMIT** command the user must wait for the OK or ERROR command response before proceeding. This response is guaranteed to be output from the receiver within 300 seconds from the time the command was received by the receiver. If an error response is returned, consult the **SOFTLOADSTATUS** log on page 841 for more detail.

**Message ID:** 475

**Abbreviated ASCII Syntax:**

```
SOFTLOADCOMMIT
```

**Input Example:**

```
SOFTLOADCOMMIT
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADCOMMIT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Reserved	-		Reserved. Set to 1 in the binary case	Enum	4	H

## 2.162 SOFTLOADDATA

*Sends firmware image data to the receiver for the SoftLoad process*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is only valid in binary mode.

This command is used to upload data to the receiver for the SoftLoad process. Refer to Updating Using SoftLoad Commands in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more information about the SoftLoad process.

After each **SOFTLOADDATA** command, the user must wait for the OK or ERROR command response before proceeding. This response is guaranteed to be output from the receiver within 15 seconds from the time the command was received by the receiver. If an error response is returned, consult the **SOFTLOADSTATUS** log on page 841 for more detail.

This command can only be sent to the receiver after the **SOFTLOADSREC** command (see page 345) or **SOFTLOADSETUP** command (see page 343) have sent the content of the S0 records from the start of a firmware \*.shex file. In these cases, the **SOFTLOADSTATUS** log (see page 841) reports READY\_FOR\_SETUP or READY\_FOR\_DATA.

**Message ID:** 1218

**Abbreviated ASCII Syntax:**

Not applicable

Field	Field Type	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADDATA header	-	NovAtel binary message header	-	H	0
2	offset	-	Offset of the data within the downloaded image	Ulong	4	H
3	data length	-	Number of bytes of data. This must match the number of bytes contained within the "data" field	Ulong	4	H+4
4	data	-	Incoming data up to a maximum of 4096 bytes	Uchar	4096	H+8

## 2.163 SOFTLOADFILE

*Updates firmware using file devices of the receiver*

Platform: PwrPak7

The **SOFTLOADFILE** command applies only to receivers with internal data storage.

Receivers with storage for data logging can also store firmware images to be flashed onto the receiver. Using FTP, .shex or .sbin files are uploaded and the **SOFTLOADFILE** command programs a firmware file to be used on next boot. ASCII **.shex** files contain the required metadata to be used directly without further user input. However, binary **.sbin** files do not and require other SOFTLOAD commands to reset the process and set the Version, Platform, and Type values. See [docs.novatel.com/OEM7/Content/Firmware\\_Update/Updating\\_Using\\_SoftLoad.htm](https://docs.novatel.com/OEM7/Content/Firmware_Update/Updating_Using_SoftLoad.htm)

Use of binary images is recommended as binary images (.sbin) take significantly less time to flash than ASCII images (.shex).

Message ID: 1302

Abbreviated ASCII Syntax:

```
SOFTLOADFILE MassStorageDevice Filename [Reserved]
```

ASCII Examples:

```
SOFTLOADFILE INTERNAL_FLASH OM7MR0705RN0000.sbin
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADFILE Header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	MassStorageDevice	INTERNAL_FLASH	4	The source device on which the firmware file is stored.	Enum	4	H
3	Filename	Character string		File name of the firmware file. (128 characters maximum)	Char (max 128)	Variable <sup>1</sup>	H+4
4	Reserved				Int	4	H+132

<sup>1</sup>In the binary case, the string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

### Binary File Example:

This example shows how to load the binary file EP7PR0705RN0000.sbin.

1. Upload the EP7PR0705RN0000.sbin firmware file via FTP.
2. Enter `LOG SOFTLOADSTATUS ONNEW`.
3. Enter `SOFTLOADRESET`.
4. Enter `SOFTLOADSETUP DATATYPE "APP"`.
5. Enter `SOFTLOADSETUP VERSION "EP7PR0705RM0000"` (version string).
6. Enter `SOFTLOADSETUP PLATFORM "OEM7700"` (must match receiver platform ID).
7. Enter `SOFTLOADFILE INTERNAL_FLASH "EP7PR0705RN0000.sbin"`.
8. Enter `RESET` when the SoftLoad status shows **COMPLETE**.

### ASCII File Example:

This example shows how to load the ASCII file EP7PR0705RN0000.shex.

1. Upload the EP7PR0705RN0000.shex firmware file via FTP.
2. Enter `LOG SOFTLOADSTATUS ONNEW`.
3. Enter `SOFTLOADFILE INTERNAL_FLASH "EP7PR0705RN0000.shex"`.
4. Enter `RESET` when the SoftLoad status shows **COMPLETE**.

## 2.164 SOFTLOADRESET

### *Initiates a new SoftLoad process*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command restarts the SoftLoad process. Refer to Updating Using SoftLoad Commands in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more information about the SoftLoad process.

The command does not affect the flash and does not reset the receiver.

The **SOFTLOADRESET** command can be issued at any time. If it is issued while a SoftLoad process is currently in progress then that process is terminated and a new one is started. After the **SOFTLOADRESET** command is processed the SOFTLOADSTATUS log will report a status of READY\_FOR\_SETUP.

After issuing the **SOFTLOADRESET** command the user must wait for the OK or ERROR command response before proceeding. This response is guaranteed to be output from the receiver within 300 seconds from the time the command was received by the receiver. If an error response is returned, consult the **SOFTLOADSTATUS** log on page 841 for more detail.

**Message ID:** 476

#### **Abbreviated ASCII Syntax:**

```
SOFTLOADRESET
```

#### **Input Example:**

```
SOFTLOADRESET
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADRESET header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Reserved	-	-	Reserved. Set to 1 in the binary case	Enum	4	H

## 2.165 SOFTLOADSETUP

***Sends configuration information to the receiver for the SoftLoad process***

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **SOFTLOADSETUP** command can be used in place of the **SOFTLOADSREC** command when sending S0 Records. This command is meant to be used if the user requires that the entire SoftLoad process be performed in binary, but can also be used in ASCII or abbreviated ASCII. The examples below are given in abbreviated ASCII for simplicity.

Refer to Updating Using SoftLoad Commands in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more information about the SoftLoad process.

This command can only be sent to the receiver when the SOFTLOADSTATUS log reports READY\_FOR\_SETUP.

After each **SOFTLOADSETUP** command, the user must wait for the OK or ERROR command response before proceeding. This response is guaranteed to be output from the receiver within 15 seconds from the time the command was received by the receiver. If an error response is returned, consult the **SOFTLOADSTATUS** log on page 841 for more detail.

NovAtel S0 records use the following format: **S0~X~<<DATA>>**, where **X** is the Setup Type and **<<DATA>>** is a NULL terminated string. To convert from S0 record to the SOFTLOADSETUP command, convert the Setup Type to the appropriate Setup type enumeration, as described in *Table 70: Available Set Up Commands* on the next page, and copy the **<<DATA>>** string in to the Setup data string.

**Message ID:** 1219

**Abbreviated ASCII Syntax:**

```
SOFTLOADSETUP setuptype setupdata
```

**Input Example:**

```
SOFTLOADSETUP datatype "APP"
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOAD SETUP header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Setup type	See <i>Table 70: Available Set Up Commands</i> on the next page		The type of setup command	Enum	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	Setup data	-	-	ASCII setup data string. See <i>Table 70: Available Set Up Commands</i> below for details on this data. This data can be pulled from the S0 records of the hex file being loaded onto the receiver. If the ASCII form of this command is used, this string must be enclosed in double quotes (" ")	String [512]	variable 1	H+4

**Table 70: Available Set Up Commands**

Binary	ASCII	Description
1	Platform	Comma separated list of platforms supported by the data to be uploaded. This corresponds to S0~P~. For example, the S-Record S0~P~OEM729,OEM7700,OEM719, translates to SOFTLOADSETUP PLATFORM "OEM729,OEM7700,OEM719"
2	Version	Version of the data to be uploaded. This corresponds to S0~V~. For example, the S-Record S0~V~OMP070400RN0000, translates to SOFTLOADSETUP VERSION "OMP070400RN0000"
3	Datatype	Intended data block for the data to be uploaded. This corresponds to S0~T~. For example, the S-Record S0~T~APP, translates to SOFTLOADSETUP DATATYPE "APP"
4	Authcode	PSN and AUTH code for the data to be uploaded. The format is: PSN:AuthCode. Note that since there are commas within the AuthCode, double quotes must surround the PSN:AuthCode string. For example:  SOFTLOADSETUP AUTHCODE "BFN10260115: T48JF2,W25DBM,JH46BJ,2WGHMJ,8JW5TW,G2SR0RCCR,101114"

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.166 SOFTLOADSREC

*Sends an S-Record to the receiver for the SoftLoad process*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to send S-Records to the receiver for the SoftLoad process. Refer to Updating Using SoftLoad Commands in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for more information about the SoftLoad process.

After each **SOFTLOADDATA** command, the user must wait for the OK or ERROR command response before proceeding. This response is guaranteed to be output from the receiver within 15 seconds from the time the command was received by the receiver. If an error response is returned, consult the **SOFTLOADSTATUS** log on page 841 for more detail.

This command can only be sent to the receiver when the SOFTLOADSTATUS log reports READY\_FOR\_SETUP or READY\_FOR\_DATA.

**Message ID:** 477

**Abbreviated ASCII Syntax:**

```
SOFTLOADSREC s-record
```

**Input Example:**

```
SOFTLOADSREC "S30900283C10FAA9F000EF"
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADSREC header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	SREC	-		ASCII S-Record string copied from firmware *.shex file	String [515]	variable 1	H
3	Reserved	-	1	Reserved. Set to 1 in the binary case	Ulong	4	variable

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 2.167 STATUSCONFIG

### *Configures RXSTATUSEVENT mask fields*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to configure the various status mask fields in the **RXSTATUSEVENT** log (see page 790). These masks can modify whether various status fields generate errors or event messages when they are set or cleared.

Receiver Errors automatically generate event messages. These event messages are output in **RXSTATUSEVENT** log (see page 790). It is also possible to have status conditions trigger event messages to be generated by the receiver. This is done by setting/clearing the appropriate bits in the event set/clear masks. The set mask tells the receiver to generate an event message when the bit becomes set. Likewise, the clear mask causes messages to be generated when a bit is cleared. To disable all these messages without changing the bits, simply UNLOG the **RXSTATUSEVENT** log (see page 790) on the appropriate ports. Refer also to Built-In Status Tests in the [OEM7 Installation and Operation User Manual](#).

**Message ID:** 95

#### **Abbreviated ASCII Syntax:**

```
STATUSCONFIG type word mask
```

#### **Factory Default:**

```
STATUSCONFIG PRIORITY STATUS 0
STATUSCONFIG PRIORITY AUX1 0x00000008
STATUSCONFIG PRIORITY AUX2 0
STATUSCONFIG SET STATUS 0x00000000
STATUSCONFIG SET AUX1 0
STATUSCONFIG SET AUX2 0
STATUSCONFIG SET AUX4 0xFFFFFFFF
STATUSCONFIG CLEAR STATUS 0x00000000
STATUSCONFIG CLEAR AUX1 0
STATUSCONFIG CLEAR AUX2 0
STATUSCONFIG CLEAR AUX4 0
```

#### **ASCII Example:**

```
STATUSCONFIG SET STATUS 0028A51D
```

The receiver gives the user the ability to determine the importance of the status bits. In the case of the Receiver Status, setting a bit in the priority mask causes the condition to trigger an error. This causes the receiver to idle all channels, set the ERROR strobe line, flash an error code on the status LED, turn off the antenna (LNA power) and disable the RF hardware, the same as if a bit in the Receiver Error word is set. Setting a bit in an Auxiliary Status priority mask causes that condition to set the bit in the Receiver Status word corresponding to that Auxiliary Status.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	STATUSCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	type	PRIORITY	0	Replace the Priority mask	Enum	4	H
		SET	1	Replace the Set mask			
		CLEAR	2	Replace the Clear mask			
3	word	STATUS	1	Receiver Status word	Enum	4	H+4
		AUX1	2	Auxiliary 1 Status word			
		AUX2	3	Auxiliary 2 Status word			
		AUX3	4	Auxiliary 3 Status word			
		AUX4	5	Auxiliary 4 Status word			
4	mask	8 digit hexadecimal		The hexadecimal bit mask	Ulong	4	H+8

## 2.168 STEADYLINE

### *Configures position mode matching*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

The STEADYLINE functionality helps mitigate the discontinuities that often occur when a GNSS receiver changes positioning modes. The effect is especially evident when a receiver transitions from an RTK position mode solution to a lower accuracy “fall back” solution, such as DGPS, WAAS+GLIDE or even autonomous GLIDE. Smooth transitions are particularly important for agricultural steering applications where sudden jumps may be problematic.

The STEADYLINE internally monitors the position offsets between all the positioning modes present in the receiver. When the receiver experiences a position transition, the corresponding offset is applied to the output position to limit a potential real position jump. When the original accurate position type returns, the STEADYLINE algorithm will slowly transition back to the new accurate position at a default rate of 0.005 m/s. This creates a smoother pass-to-pass relative accuracy at the expense of a possible degradation of absolute accuracy.

For example, a receiver can be configured to do both RTK and GLIDE. If this receiver has a fixed RTK position and experiences a loss of correction data causing the loss of the RTK solution it will immediately apply the offset between the two position modes and uses the GLIDE position stability to maintain the previous trajectory. Over time the GLIDE (or non-RTK) position will experience some drift. Once the RTK position is achieved again the receiver will start using the RTK positions for position stability and will slowly transition back to the RTK positions at a default rate of 0.005 m/s.

**Message ID:** 1452

**Abbreviated ASCII Syntax:**

```
STEADYLINE mode [transition_time]
```

**Factory Default:**

```
STEADYLINE disable
```

**ASCII Example:**

```
STEADYLINE prefer_accuracy 100
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	STEADYLINE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	See <i>Table 71: STEADYLINE Mode</i> on the next page		STEADYLINE mode	Enum	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	Transition time			Time over which solutions will transition in seconds. The minimum rate of change is 0.005 m/s regardless of this parameter.  Default = -1, which sets the parameter to the minimum value 0.005m/s.	Ulong	4	H+4

Table 71: STEADYLINE Mode

ASCII	Binary	Description
DISABLE	0	Disable STEADYLINE (default)
RESET	3	Reset the offsets, jump immediately to the current position and continue in the current mode.
PREFER_ACCURACY	4	Slowly transition to the new reference position when changing from less accurate reference positioning type to more accurate reference positioning type. Maintains the position offset calculated when changing from more accurate reference positioning type to a less accurate reference positioning type.

## 2.169 STEADYLINEDIFFERENTIALTIMEOUT

**Sets how long the receiver will report RTK/PPP after corrections are lost**

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to set how long STEADYLINE will report RTK or PPP solutions after a loss of corrections. If able, STEADYLINE will report an RTK or PPP solution until this timeout expires or until the RTK/PPP timeout expires, whichever is higher.

For example:

- If the **RTKTIMEOUT** is 60 seconds and the **STEADYLINEDIFFERENTIALTIMEOUT** is 300 seconds, STEADYLINE will report an RTK solution for 300 seconds.
- If the **RTKTIMEOUT** is 60 seconds and the **STEADYLINEDIFFERENTIALTIMEOUT** is 30 seconds, STEADYLINE will report an RTK solution for 60 seconds.

**Message ID:** 2002

**Abbreviated ASCII Syntax:**

```
STEADYLINEDIFFERENTIALTIMEOUT timeout
```

**Factory Default:**

```
STEADYLINEDIFFERENTIALTIMEOUT 60
```

**ASCII Example:**

```
STEADYLINEDIFFERENTIALTIMEOUT 300
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	STEADYLINE DIFFERENTIALTIMEOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	timeout	5 to 1200		Timeout period in seconds	Float	4	H

## 2.170 SURVEYPOSITION

### *Saves or deletes a surveyed position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this command to add or delete a surveyed position saved in the receiver NVM.

The surveyed positions added or deleted with this command are used in conjunction with the **AUTOSURVEY** command on page 80.

**Message ID:** 1952

#### Abbreviated ASCII Syntax:

```
SURVEYPOSITION option id [latitude] [longitude] [height] [tolerance]
```

#### ASCII Examples:

```
SURVEYPOSITION save auto 51.116 -114.038 1065.0 10.0
```

```
SURVEYPOSITION delete cal2
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SURVEY POSITION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	SAVE	1	Save the surveyed position in the receiver NVM	Enum	4	H
		DELETE	2	Delete the surveyed position from the receiver NVM			
3	id	4 character string		<p>ID for the saved position</p> <p>When saving a position, "AUTO" can be entered and the receiver will automatically generate a unique ID for the position.</p> <p>"AUTO" cannot be used when deleting a position.</p> <p>To determine the ID for a saved position, use the <b>SAVEDSURVEYPOSITIONS</b> log on page 801.</p> <p><b>Note:</b> In the Binary case, the ID string must be null terminated and additional bytes of padding must be added to make the total length of the field 8 bytes.</p>	String [5]	8	H+4

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	latitude	-90 to 90		Latitude of the position in degrees (default=0.0) A "-" sign denotes south and a "+" sign denotes north	Double	8	H+12
5	longitude	-360 to 360		Longitude of the position in degrees (default=0) A "-" sign denotes west and a "+" sign denotes east	Double	8	H+20
6	height	-1000 to 20000000		Mean Sea Level height of the position in meters (default=0.0)	Double	8	H+28
7	tolerance	3 - 100		Position tolerance in meters (default=10.0) The maximum distance between the position calculated during a self-survey and the saved position. During the self-survey, if the distance between the calculated position and the previously surveyed position is less than this value, the previous position is used.	Double	8	H+36

## 2.171 TECTONICSCOMPENSATIONSOURCE

*Chooses the model to use for tectonics compensation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Use this command to enable tectonics (plate motion) compensation.

**Message ID:** 2290

**Abbreviated ASCII Syntax:**

```
TECTONICSCOMPENSATIONSOURCE model
```

**Factory Default:**

```
TECTONICSCOMPENSATIONSOURCE plate_motion_model
```

**ASCII Example:**

```
TECTONICSCOMPENSATIONSOURCE none
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	TECTONICS COMPENSATION SOURCE header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	model	NONE	0	Do not use a tectonics model.	Enum	4	H
		PLATE_MOTION_MODEL	1	Automatically determine the plate the receiver is on and use the plate motion model of that plate.			
3	reserved				Char [32]	variable	H+4

## 2.172 TERRASTARAUTOCHANCONFIG

### *Enable channel configurations granted by eligible TerraStar subscriptions*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This command allows the receiver to use a multi-constellation, multi-frequency channel configuration while a TerraStar-X, TerraStar-C PRO or RTK ASSIST PRO subscription is active. This allows the receiver to make the best use of the TerraStar subscription while computing PPP position solutions. Multi-constellation, multi-frequency channel configurations give better accuracy and faster convergence time compared to a dual-constellation, dual-frequency channel configuration.

To enable this feature, issue the **TERRASTARAUTOCHANCONFIG ENABLE** command, followed by a **SAVECONFIG** command (see page 302). If a TerraStar-X, TerraStar-C PRO or RTK ASSIST PRO subscription is active, as reflected in the **TERRASTARINFO** log (see page 849), the channel configuration (see **CHANCONFIGLIST** log on page 451) will be modified on the next reboot.

**Message ID:** 2284

#### Abbreviated ASCII Syntax:

```
TERRASTARAUTOCHANCONFIG switch
```

#### Factory Default:

```
TERRASTARAUTOCHANCONFIG ENABLE
```

#### ASCII Example:

```
TERRASTARAUTOCHANCONFIG ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	TERRASTARAUTOCHANCONFIG header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	switch	DISABLE	0	The receiver does not use the channel configuration granted by the TerraStar subscription.	Enum	4	H
		ENABLE	1	The receiver uses the channel configuration granted by the TerraStar subscription.			

## 2.173 THISANTENNAPCO

### *Sets the PCO model of this receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use the **THISANTENNAPCO** command to set the Phase Center Offsets (PCO) for the given frequency of this receiver. The Offsets are defined as North, East and Up from the Antenna Reference Point to the Frequency Phase Center in mm.

**Message ID:** 1417

#### Abbreviated ASCII Syntax:

```
THISANTENNAPCO Frequency [NorthOffset] [EastOffset] [UpOffset]
```

#### ASCII Example:

```
THISANTENNAPCO GPSL1 0.61 1.99 65.64
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	THISANTENNAPCO header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Frequency	See <i>Table 19: Frequency Type</i> on page 82		The frequency for which the phase center offsets are valid.	Enum	4	H
3	North Offset			NGS standard Phase Center North Offset (millimeters). <sup>1</sup>	Double	8	H+4
4	East Offset			NGS standard Phase Center East Offset (millimeters). <sup>1</sup>	Double	8	H+12
5	Up Offset			NGS standard Phase Center Up Offset (millimeters). <sup>1</sup>	Double	8	H+20

<sup>1</sup>Enter values as per the NGS standards and tables to define which direction is plus or minus.

## 2.174 THISANTENNAPCV

### *Sets the PCV model of this receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use the **THISANTENNAPCV** command to set the Phase Center Variation (PCV) for the given frequency of this receiver. The Phase Center Variation entries follow the NGS standard and correspond to the phase elevation at 5 degree increments starting at 90 degrees and decreasing to 0.

**Message ID:** 1418

#### Abbreviated ASCII Syntax:

```
THISANTENNAPCV Frequency[PCVArray]
```

#### ASCII Example:

```
THISANTENNAPCV GPSL1 0.00 -0.020 -0.07 -0.15 -0.24 -0.34 -0.43 -0.51 -0.56 -
0.61 -0.65 -0.69 -0.69 -0.62 -0.44 -0.13 0.28 0.70 1.02
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	THISANTENNAPCV header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Frequency	See <i>Table 19: Frequency Type</i> on page 82		The frequency for which the phase center variations is valid.	Enum	4	H
3	PCV Array			NGS standard 19 Element array of Phase Center Variations for phase variation for 5 degree elevation increments starting at 90 degrees and decreasing to 0. The variances are entered in millimeters.	Double Array [19]	152	H+4

## 2.175 THISANTENNATYPE

*Sets the antenna type of this receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use the **THISANTENNATYPE** command to set the type of antenna being used with the receiver. There are two sources of antenna information:

- An internal table  
The firmware contains a set of predefined antenna and radome types taken from the IGS ANTEX file. Refer to *Table 20: Antenna Type* on page 86 and *Table 21: Radome Type* on page 95 for the antennas currently supported.
- User-defined antennas  
User-defined antenna types can be entered using the **ANTENNATYPE** command (see page 67).

The **BASEANTENNATYPE** command (see page 85) is used to set the RTK base antenna type.

**Message ID:** 1420

**Abbreviated ASCII Syntax:**

```
THISANTENNATYPE AntennaType [RadomeType]
```

**ASCII Examples:**

```
THISANTENNATYPE NOV702
```

```
THISANTENNATYPE USER_ANTENNA_1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	THISANTENNATYPE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	AntennaType	See <i>Table 20: Antenna Type</i> on page 86 or <i>Table 14: User-Defined Antenna Type</i> on page 68		Antenna type	Enum	4	H
3	RadomeType	See <i>Table 21: Radome Type</i> on page 95		Radome type (default = NONE)	Enum	4	H+4

## 2.176 TRACKSIGNAL

### *Enable or disable tracking of a signal*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to enable or disable tracking of a signal within the channel configuration signal list.

Primary signals (LBAND and L1/E1/B1I signals) can not be disabled using the **TRACKSIGNAL** command

**Message ID:** 2311

#### Abbreviated ASCII Syntax:

```
TRACKSIGNAL signal track
```

#### Abbreviated ASCII Example:

```
TRACKSIGNAL GPSL2C DISABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	TRACKSIGNAL header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	signal	See <i>Table 72: Signal</i> below		The signal to enable or disable <b>Note:</b> The signal is expected to match a signal in the current channel configuration.	Enum	4	H
3	track	DISABLE	0	Disable tracking of the signal	Enum	4	H+4
		ENABLE	1	Enable tracking of the signal			

**Table 72: Signal**

Binary	ASCII
1	GPSL2
2	GPSL2P
3	GPSL2C
4	GPSL5
5	GPSL1C
6	SBASL5
7	GLOL2

Binary	ASCII
8	GLOL2P
9	GLOL2C
10	GLOL3
11	GALE5A
12	GALE5B
13	GALALTBOC
14	GALE6
15	QZSSL2C
16	QZSSL5
17	QZSSL1C
18	QZSSL6
19	BEIDOUB1C
20	BEIDOUB2
21	BEIDOUB3
22	BEIDOUB2B

## 2.177 TRACKSV

### *Overrides automatic satellite assignment criteria*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to override the automatic satellite/channel assignment for all satellites with manual instructions.

**Message ID:** 1326

#### Abbreviated ASCII Syntax:

```
TRACKSV system SVID condition
```

#### Factory Default:

```
GPS, GLONASS, GALILEO, QZSS, BeiDou and NavIC default = GOODHEALTH
SBAS default = ANYHEALTH
```

```
TRACKSV QZSS 198 NEVER
```

```
TRACKSV QZSS 202 NEVER
```

QZSS 198 and QZSS 202 are excluded because they are defined as test PRNs in the QZSS ICD.

#### Input Example:

```
TRACKSV GALILEO 0 ANYHEALTH
```

For dual antenna receivers, this command applies to both the primary and secondary antennas.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	TRACKSV header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	System	See <i>Table 118: Satellite System</i> on page 561		System that the SVID belongs to	Enum	4	H
3	SVID	Refer to <i>PRN Numbers</i> on page 48		Satellite SVID number "0" is allowed and applies to all SVIDs for the specified system type	Ulong	4	H+4
4	Condition	See <i>Table 73: TRACKSV Command Condition</i> on the next page		Tracking condition	Enum	4	H+8

**Table 73: TRACKSV Command Condition**

<b>Binary</b>	<b>ASCII</b>	<b>Description</b>
1	NEVER	Never track this satellite
2	GOODHEALTH	Track this satellite if the health is indicated as healthy in both the almanac and ephemeris
3	ANYHEALTH	Track this satellite regardless of health status
4	ALWAYS	Always track this satellite

## 2.178 TUNNELESCAPE

### *Breaks out of an established tunnel*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The tunnel escape sequence feature allows you to break out of a tunnel between two ports by sending a pre-defined sequence of bytes through the tunnel in-line with the data stream.

Use the **TUNNELESCAPE** command to specify the tunnel escape sequence. The escape sequence is applied independently to all active tunnels. Use the **SAVECONFIG** command (see page 302) to save the escape sequence in case of a power cycle.

This command is used to define an escape sequence that, when detected in a byte stream between any two COM (or AUX) ports, resets the interface mode to **NOVATEL NOVATEL** on those ports. The baud rate and other port parameters remain unaffected.

The **TUNNELESCAPE** command accepts three parameters. The first is the *switch* parameter with **ENABLE** or **DISABLE** options. The second is the *length* parameter. It is a number from 1 to 8 and must be present if the switch parameter is set to **ENABLE**. The third parameter, *esc seq*, consists of a series of pairs of digits representing hexadecimal numbers, where the number of pairs are equal to the value entered for the second parameter. The series of hexadecimal pairs of digits represent the escape sequence. The receiver detects a sequence in a tunnel exactly as it was entered.

For example, the command **TUNNELESCAPE ENABLE 4 61626364** searches for the bytes representing “abcd” in a tunnel stream. **TUNNELESCAPE ENABLE 3 AA4412** searches for the NovAtel binary log sync bytes.

You must first set up a tunnel. For example, create a tunnel between COM1 and COM2 by entering **INTERFACEMODE COM1 TCOM2 NONE OFF**. The commands can be entered in any order.

1. All bytes, leading up to and including the escape sequence, pass through the tunnel before it is reset. Therefore, the escape sequence is the last sequence of bytes that passes through the tunnel. Configure the receiver to detect and interpret the escape sequence. For example, use this information to reset equipment or perform a shutdown process.
2. The receiver detects the escape sequence in all active tunnels in any direction.
3. Create tunnels using the **INTERFACEMODE** command (see page 189).

**Message ID: 962**

#### **Abbreviated ASCII Syntax:**

```
TUNNELESCAPE switch length escseq
```

#### **Factory Default:**

```
TUNNELESCAPE disable 0
```

#### **ASCII Example:**

```
TUNNELESCAPE enable 1 aa
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	TUNNELESCAPE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	H	0	-
2	switch	DISABLE	0	Enable or disable the tunnel escape mode	Enum	4	H
		ENABLE	1				
3	length	1 to 8		Specifies the number of hex bytes to follow	Ulong	4	H+4
4	escseq			Escape sequence where Hex pairs are entered without spaces, for example, AA4412	Uchar [8]	8	H+8

If using the **SAVECONFIG** command (see page 302) in NovAtel Connect, ensure all windows other than the *Console* window are closed. If open, NovAtel Connect also saves log commands used for its various windows. This results in unnecessary data being logged.

## 2.179 UALCONTROL

### Setup User Accuracy levels

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The **UALCONTROL** command is used to define User Accuracy Levels. User accuracy levels are user defined standard deviations thresholds, used to determine solution acceptability. Issuing the **UALCONTROL** command causes the BESTPOS and GPGGA solution types to be controlled via the specified thresholds, rather than by the solution source or mode. The new solution types are described in the table below.

**Table 74: User Accuracy Level Supplemental Position Types and NMEA Equivalents**

Value	BESTPOS Position Type <sup>1</sup>	NMEA Equivalent <sup>2</sup>
70	OPERATIONAL	4
71	WARNING	5
72	OUT_OF_BOUNDS	1

1. As reported in the **BESTPOS** log (see page 429).  
2. Refers to the GPGGA quality indicator (see the **GPGGA** log on page 517 for details).

The **SETBESTPOSCRITERIA** command (see page 327) determines which standard deviations are compared against the provided thresholds.

UAL is useful for applications that rely upon specific solutions types being present in the BESTPOS or GPGGA logs. For example, if an agricultural steering system commonly requires an RTK fixed GPGGA solution type (4) to operate, and interruptions in RTK conventionally cause the GPGGA to switch to another solution type. This causes the steering system to disengage.

**Message ID: 1627**

**Abbreviated ASCII Syntax:**

```
UALCONTROL Action [Operational_limit] [Warning_limit]
```

**Factory Default:**

```
UALCONTROL disable
```

**ASCII Example:**

```
UALCONTROL enable 0.10 0.20
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UALCONTROL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Action	DISABLE	0	Disables this feature	Enum	4	H
		ENABLE	1	Replace BESTPOS and GPGGA position types with OPERATIONAL, WARNING or OUT_OF_BOUNDS based on the entered standard deviations (refer to <i>Table 74: User Accuracy Level Supplemental Position Types and NMEA Equivalents</i> on the previous page)			
		CLEAR	2	Disable this feature and reset the entered standard deviations.			
3	Operational Limit			Standard deviation in meters to report OPERATIONAL	Double	8	H+4
4	Warning Limit			Standard deviation in meters to report WARNING <b>Note:</b> OUT_OF_BOUND reports when the standard deviation exceeds this value	Double	8	H+12

## 2.180 UNASSIGN

### *Unassigns a previously assigned channel*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command cancels a previously issued **ASSIGN** command (see page 70) and the SV channel reverts to automatic control (the same as **ASSIGN AUTO**).

**Message ID:** 29

#### Abbreviated ASCII Syntax:

```
UNASSIGN channel [state]
```

#### Input Example:

```
UNASSIGN 11
```

Issuing the **UNASSIGN** command to a channel that was not previously assigned by the **ASSIGN** command (see page 70) has no effect.

For dual antenna receivers:

- On the primary antenna, the SV channel is from 0 to N-1, where N is the number of channels in the primary antenna channel configuration.
- On the secondary antenna, the SV channel count is from at N to N+(M-1), where M is the number of channels in the secondary antenna SV channel configuration.
- Even though L-Band channels cannot be configured with **ASSIGN** or **UNASSIGN**, they are included when determining N.

The **ASSIGN** and **UNASSIGN** commands are not accepted for L-Band channels. The **ASSIGNLBANDBEAM** command (see page 75) should be used for L-Band channels.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNASSIGN header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	channel	0 to N-1, where N is the number of the last GNSS channel in the current channel configuration		Channel number reset to automatic search and acquisition mode	Ulong	4	H

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
3	state	These return SV channel control to the automatic search engine immediately (see <i>Table 15: Channel State</i> on page 72)		Set the SV channel state (currently ignored)	Enum	4	H+4

## 2.181 UNASSIGNALL

### *Unassigns all previously assigned channels*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command cancels all previously issued **ASSIGN** or **ASSIGNALL** commands for all SV channels for a satellite system (same as **ASSIGNALL AUTO**). Tracking and control for each SV channel reverts to automatic mode.

**Message ID:** 30

#### Abbreviated ASCII Syntax:

```
UNASSIGNALL [system]
```

#### Input Example:

```
UNASSIGNALL GPS
```

Issuing the **UNASSIGNALL** command has no effect on channels that were not previously assigned using the **ASSIGN** command (see page 70) or **ASSIGNALL** command (see page 73).

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNASSIGNALL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	system	See <i>Table 16: Satellite System</i> on page 74		System that will be affected by the <b>UNASSIGNALL</b> command (default = ALL)	Enum	4	H

## 2.182 UNDULATION

### *Chooses undulation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command permits you to enter a specific geoidal undulation value. In the option field, the EGM96 table provides ellipsoid heights at a 0.5° by 0.5° spacing while the OSU89B is implemented at a 2° by 3° spacing. In areas of rapidly changing elevation, you could be operating somewhere within the 2° by 3° grid with an erroneous height. EGM96 provides a more accurate model of the ellipsoid which results in a denser grid of heights. It is also more accurate because the accuracy of the grid points themselves has also improved from OSU89B to EGM96. For example, the default grid (EGM96) is useful where there are underwater canyons, steep drop-offs or mountains.

The undulation values reported in the position logs are in reference to the ellipsoid of the chosen datum.

Refer to the application note [APN-006: Geoid Issue](https://www.novatel.com/support/support-materials/application-notes), available at [novatel.com/support/support-materials/application-notes](https://www.novatel.com/support/support-materials/application-notes), for a description of the relationships in *Figure 11: Illustration of Undulation* below.

**Figure 11: Illustration of Undulation**

**Message ID: 214**

#### **Abbreviated ASCII Syntax:**

```
UNDULATION option [separation]
```

#### **Factory Default:**

```
UNDULATION egm96 0.0000
```

#### **ASCII Example 1:**

```
UNDULATION osu89b
```

#### **ASCII Example 2:**

```
UNDULATION USER -5.599999905
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNDULATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	USER	1	Use the user specified undulation value	Enum	4	H
		OSU89B	2	Use the OSU89B undulation table			
		EGM96	3	Use global geoidal height model EGM96 table			
3	separation	±1000.0 m		The undulation value (required for the USER option) (default = 0.000)	Float	4	H+4

## 2.183 UNLOCKOUT

### *Reinstates a satellite in the solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command allows a satellite which has been previously locked out (**LOCKOUT** command on page 213) to be reinstated in the solution computation. If more than one satellite is to be reinstated, this command must be reissued for each satellite reinstatement.

**Message ID:** 138

#### Abbreviated ASCII Syntax:

```
UNLOCKOUT prn
```

#### Input Example:

```
UNLOCKOUT 8
```

The **UNLOCKOUT** command is used to reinstate a satellite while leaving other locked out satellites unchanged.

This command can be used for GPS, GLONASS, SBAS and QZSS.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOCKOUT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	prn	Refer to <i>PRN Numbers</i> on page 48		A single satellite PRN number to be reinstated	Ulong	4	H

## 2.184 UNLOCKOUTALL

***Reinstates all previously locked out satellites***

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command allows all satellites or systems which have been previously locked out (**LOCKOUT** command on page 213 or **LOCKOUTSYSTEM** command on page 214) to be reinstated in the solution computation.

**Message ID:** 139

**Abbreviated ASCII Syntax:**

UNLOCKOUTALL

**Input Example:**

UNLOCKOUTALL

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOCKOUTALL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

## 2.185 UNLOCKOUTSYSTEM

### *Reinstates previously locked out system*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command allows a system which has been previously locked out (refer to the **LOCKOUTSYSTEM** command on page 214) to be reinstated in the solution computation.

If more than one system is to be reinstated, this command must be reissued for each system reinstatement.

**Message ID: 908**

#### **Abbreviated ASCII Syntax:**

```
UNLOCKOUTSYSTEM system
```

#### **Input Example:**

```
UNLOCKOUTSYSTEM glonass
```

The **UNLOCKOUTSYSTEM** command is used to reinstate a system while leaving other locked out systems unchanged.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOCKOUT SYSTEM header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	system	See <i>Table 118: Satellite System</i> on page 561		A single satellite system to be reinstated	Enum	4	H

## 2.186 UNLOG

### *Removes a log from logging control*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is used to remove a specific log request from the system.

**Message ID:** 36

#### Abbreviated ASCII Syntax:

```
UNLOG [port] message
```

#### Input Example:

```
UNLOG com1 bestposa
```

```
UNLOG bestposa
```

The **UNLOG** command is used to remove one or more logs while leaving other logs unchanged.

### 2.186.1 Binary

Field	Field Name	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOG (binary) header	(See Table 3: <i>Binary Message Header Structure</i> on page 34)	This field contains the message header	-	H	0
2	port	See Table 4: <i>Detailed Port Identifier</i> on page 36 (decimal port values greater than 16 may be used)	Port to which log is being sent	Enum	4	H
3	message	Any valid message ID	Message ID of log to output	Ushort	2	H+4
4	message type	Bits 0-4 = Reserved Bits 5-6 = Format 00 = Binary 01 = ASCII 10 = Abbreviated ASCII, NMEA 11 = Reserved Bit 7 = Response Bit ( <i>Message Responses</i> on page 45) 0 = Original Message 1 = Response Message	Message type of log	Char	1	H+6
5	Reserved			Char	1	H+7

**2.186.2 ASCII**

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOG (ASCII) header	-	-	This field contains the command name or the message header depending on whether the command is abbreviated ASCII or ASCII, respectively	-	H	0
2	port	See <i>Table 4: Detailed Port Identifier</i> on page 36 (decimal port values greater than 16 may be used)		Port to which log is being sent (default = THISPORT)	Enum	4	H
3	message	Message Name	N/A	Message Name of log to be disabled	Ulong	4	H+4

## 2.187 UNLOGALL

### *Removes all logs from logging control*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

If *[port]* is specified, this command disables all logs on the specified port only. All other ports are unaffected. If *[port]* is not specified this command defaults to the ALL\_PORTS setting.

**Message ID:** 38

#### Abbreviated ASCII Syntax:

```
UNLOGALL [port] [held]
```

#### Input Example:

```
UNLOGALL com2_15
```

```
UNLOGALL true
```

The **UNLOGALL** command is used to remove all log requests currently in use.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UNLOGALL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	port	See <i>Table 4: Detailed Port Identifier</i> on page 36 (decimal values greater than 16 may be used)		Port to clear (default = ALL_PORTS)	Enum	4	H
3	held	FALSE	0	Does not remove logs with the HOLD parameter (default)	Bool	4	H+4
		TRUE	1	Removes previously held logs, even those with the HOLD parameter			

## 2.188 USBSTICKEJECT

### *Prepare a USB stick for removal*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

PwrPak7M variants do not support this command.

Use this command to unmount the USB stick and prepare it for safe physical removal.

This command may fail with a *Busy* error if there is an ongoing USB stick mounting or unmounting operation.

The **FILETRANSFERSTATUS** log (see page 474) indicates the *USBSTICK UNMOUNTED* status when it is safe to physically remove the stick. This may take up to 10 seconds.

**Message ID:** 2115

**Abbreviated ASCII Syntax:**

```
USBSTICKEJECT
```

**Example:**

```
USBSTICKEJECT
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	USBSTICKEJECT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

## 2.189 USERDATUM

### *Sets user customized ellipsoid and datum transformation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command is like the **USEREXPDATUM** command but without parameter rates. See the **USEREXPDATUM** command on page 380 for details on command usage and parameter meaning.

When the **USERDATUM** command is entered, the **USEREXPDATUM** command on page 380 is issued internally with the **USERDATUM** command values. It is the **USEREXPDATUM** command on page 380 that appears in the **RXCONFIG** log (see page 775). Only a single set of **USEREXPDATUM** or **USERDATUM** entered parameters is valid at one time. Newer parameters entered by either command will overwrite previously entered parameters.

See the **DATUM** command on page 119 for important guidance and details on datum operation.

**Message ID:** 78

#### Abbreviated ASCII Syntax:

```
USERDATUM semi_major_axis flattening dx dy dz rx ry rz scale
```

#### Factory Default:

```
USERDATUM 6378137.0 298.2572235628 0.0 0.0 0.0 0.0 0.0 0.0 0.0
```

#### ASCII Example:

```
USERDATUM 6378206.400 294.97869820000 -12.0000 147.0000 192.0000 0.0000
0.0000 0.0000 0.000000000
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	USERDATUM header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	semi_major_axis	6300000.0 - 6400000.0		Datum semi-major axis (a) (meters)	Double	8	H
3	flattening	290.0 - 305.0		Reciprocal Flattening, $1/f = a/(a-b)$	Double	8	H+8
4	dx	± 2000.0		Translation values (meters)	Double	8	H+16
5	dy	± 2000.0			Double	8	H+24
6	dz	± 2000.0			Double	8	H+32

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
7	rx	± 10.0 radians		Datum rotation angles	Double	8	H+40
8	ry	± 10.0 radians		A positive sign is for counter clockwise rotation and a negative sign is for clockwise rotation	Double	8	H+48
9	rz	± 10.0 radians			Double	8	H+56
10	scale	± 10.0 ppm			Scale value is the difference in ppm	Double	8

## 2.190 USEREXPDATUM

### *Set custom expanded datum*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command permits entry of customized ellipsoid and datum transformation parameters. The command **DATUM USER** must be sent for the parameters set by **USERDATUM** to take effect.

Only a single set of **USEREXPDATUM** or **USERDATUM** entered parameters is valid at one time. Newer parameters entered by either command will overwrite previously entered parameters.

The transformation used by this command is the 7 parameter Helmert transformation, with the parameters provided being for the transformation from the user datum to WGS84:

$$\begin{bmatrix} X_s \\ Y_s \\ Z_s \end{bmatrix} = \begin{bmatrix} T_x \\ T_y \\ T_z \end{bmatrix} + (1 + s) \begin{bmatrix} 1 & -R_z & R_y \\ R_z & 1 & -R_x \\ -R_y & R_x & 1 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \end{bmatrix}$$

Where:

**X, Y, Z** are the coordinates in the user datum

**X<sub>s</sub>, Y<sub>s</sub>, Z<sub>s</sub>** are the coordinates in WGS84

**T<sub>x</sub>, T<sub>y</sub>, T<sub>z</sub>** are the translation parameters corrected for translation rate (meters)

**R<sub>x</sub>, R<sub>y</sub>, R<sub>z</sub>** are the rotation parameters corrected for rotation rate (radians)

**s** is the scale difference corrected for scale rate (unitless)

A given parameter P is corrected for rate:

$$P(t) = P(t_r) + \dot{P}(t_r)(t - t_r)$$

Where:

**t<sub>r</sub>** is the reference epoch of the parameters

**t** is the current epoch

**P(t<sub>r</sub>)** is the parameter at the reference epoch

**Ḑ(t<sub>r</sub>)** is the rate of the parameter at the reference epoch

The convention used by this command differs from that used by the **DATUMTRANSFORMATION** command on page 121, and from parameter conventions seen typically in transformation sources. Care should be taken that the parameter convention matches that in the equation above.

See the **DATUM** command on page 119 for important guidance and details on datum operation.

**Message ID: 783**

#### **Abbreviated ASCII Syntax:**

```
USEREXPDATUM semi_major_axis flattening dx dy dz rx ry rz scale xvel yvel
zvel xrvel yrvel zrvel scalelevel epoch
```

**Factory Default:**

```
USEREXPDATUM 6378137.0 298.25722356280 0.0 0.0 0.0 0.0 0.0 0.0 0.0 0.0 0.0 0.0
0.0 0.0 0.0 0.0 0.0 0.0
```

**ASCII Example:**

```
USEREXPDATUM 6378137.000 298.25722356280 0.000000000 0.000000000 0.000000000
0.000000000 0.000000000 0.000000000 0.000000000 0.000000000 0.000000000
0.000000000 0.0000 0.000000000 0.000000000 0.000000000 0.000000000
```

Use the **USEREXPDATUM** command in a survey to fix the position with values from another known datum so that the GPS calculated positions are reported in the known datum rather than WGS84. For example, it is useful for places like Australia, where the continent is moving several centimeters a year relative to WGS84. With **USEREXPDATUM**, you can also input the velocity of the movement to account for drift over the years.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	USEREXPDATUM header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	semi_major_axis	6300000.0 - 6400000.0 m		Datum semi-major axis (a) (meters)	Double	8	H
3	flattening	290.0 - 305.0		Reciprocal Flattening, $1/f = a/(a-b)$	Double	8	H+8
4	dx	± 2000.0 m		Translation values (meters)	Double	8	H+16
5	dy	± 2000.0 m			Double	8	H+24
6	dz	± 2000.0 m			Double	8	H+32
7	rx	± 10.0 radians		Datum rotation angles A positive sign is for counter clockwise rotation and a negative sign is for clockwise rotation	Double	8	H+40
8	ry	± 10.0 radians			Double	8	H+48
9	rz	± 10.0 radians			Double	8	H+56
10	scale	± 10.0 ppm		Scale value is the difference in ppm	Double	8	H+64
11	xvel	± 2000.0 m/yr		Velocity vector along X-axis	Double	8	H+72
12	yvel	± 2000.0 m/yr		Velocity vector along Y-axis	Double	8	H+80
13	zvel	± 2000.0 m/yr		Velocity vector along Z-axis	Double	8	H+88
14	xrvel	± 10.0 radians/yr		Change in the rotation about X over time	Double	8	H+96
15	yrvel	± 10.0 radians/yr		Change in the rotation about Y over time	Double	8	H+104
16	zrvel	± 10.0 radians/yr		Change in the rotation about Z over time	Double	8	H+112

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
17	scalelevel	± 10.0 ppm/yr		Change in scale from WGS84 over time	Double	8	H+120
18	epoch	0.0 year		Reference epoch of parameters (decimal year) Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	H+128

## 2.191 USERI2CBITRATE

**Set the communication rate for the User I2C bus**

**Platform:** OEM7600, OEM7700, OEM7720

Use this command to set the communication bit rate for the User I2C bus.

**Message ID:** 2383

**Abbreviated ASCII Syntax:**

```
USERI2CBITRATE BitRate
```

**Factory Default:**

```
USERI2CBITRATE 400K
```

**ASCII Examples:**

```
USERI2CBITRATE 100K
```

```
USERI2CBITRATE 400K
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	USERI2CBITRATE header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	BitRate	100K	1	Set the User I2C bus communication rate to 100 kbits/s.	Enum	4	H
		400K	2	Set the User I2C bus communication rate to 400 kbits/s.			

## 2.192 USERI2CREAD

### *Read data from devices on the I2C bus*

**Platform:** OEM7600, OEM7700, OEM7720

Use this command to read data from devices on the I2C bus.

This command only applies to OEM7 receivers that have I2C signals available on the interface connector. The compatible receivers are listed in the **Platform** section above.

The **USERI2CRESPONSE** log (see page 865) can be used to check the completion or status of the read operation. An optional user defined Transaction ID can be provided to help synchronize requests with responses in the **USERI2CRESPONSE** log (see page 865). This command is primarily intended to be used by Lua applications that need to interact with external devices.

Reading from an I2C device requires a device address, to distinguish which physical device is to be accessed, a register within the device, and the expected number of bytes to be read. Depending on the type of I2C device, register addresses can be 1 to 4 bytes in length, so the actual number of bytes for the register address must be specified.

For some I2C devices there are no registers within the device. In this case, the Register Address Length is 0 and no bytes are supplied for the Register Address.

The **USERI2CREAD** command is flexible to handle all of these situations.

**Message ID: 2232**

#### Abbreviated ASCII Syntax:

```
USERI2CREAD DeviceAddress RegisterAddressLen RegisterAddress RequestReadLen
[TransactionID]
```

#### Examples:

```
USERI2CREAD 70 1 AB 12 1234
USERI2CREAD 74 3 ABCDEF 234 5678
USERI2CREAD 74 0 234 5678
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	USERI2CREAD header	Command header. See Messages for more information.	-	H	0
2	DeviceAddress	The 7 bit address of the I2C device. Valid values are 0 through 127. For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits. There is no 0x prefix and spaces are not allowed in the string.	Uchar	1 <sup>1</sup>	H

<sup>1</sup>In the binary case, additional bytes of padding are added after this field to maintain 4-byte alignment for the fields that follow.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
3	RegisterAddressLen	The length of the register address that follows. Valid values are 0 through 4.	Ulong	4	H+4
4	RegisterAddress	The actual address of the register to be read. The number of bytes here must match the RegisterAddressLen. In particular, when RegisterAddressLen is 0, this field is empty (even for a binary command)  For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits for each byte in the register address. There is no 0x prefix and spaces are not allowed in the string.	Uchar Array	X <sup>1</sup>	H+8
5	RequestReadLen	The length of data expected to be retrieved from the device. Valid values are 1 through 256.	Ulong	4	H+12 <sup>1</sup>
6	TransactionID	An optional user provided ID for this transaction. Default = 0.  This transaction ID will be copied to the <b>USERI2CRESPONSE</b> log (see page 865) created for this read operation.	Ulong	4	H+16 <sup>2</sup>

<sup>1</sup>H+8 if X=0<sup>2</sup>H+12 if X=0

## 2.193 USERI2CWRITE

### *Write data to device on I2C bus*

**Platform:** OEM7600, OEM7700, OEM7720

Use this command to write data to devices on the I2C bus.

This command only applies to OEM7 receivers that have I2C signals available on the interface connector. The compatible receivers are listed in the **Platform** section above.

The **USERI2CRESPONSE** log (see page 865) can be used to check the completion or status of the write operation. An optional user defined Transaction ID can be provided to help synchronize requests with responses in the **USERI2CRESPONSE** log (see page 865). This command is primarily intended to be used by Lua applications that need to interact with external devices.

Writing to an I2C device requires a device address, to distinguish which physical device is to be accessed, a register within the device and the data. Depending on the type of I2C device, register addresses can be 1 to 4 bytes in length, and so the actual number of bytes for the register address must be specified.

For some I2C devices there are no registers within the device. In this case, the Register Address Length is 0, and no bytes are supplied for the Register Address.

For some other I2C devices, write operations are done in two stages:

1. The first stage sends a write command with a register address, but no data. This is a dummy write to set the register within the device for write operations that follow.
2. The second stage sends a write command with no register address, but does send a stream of data.

The **USERI2CWRITE** command is flexible to handle all of these situations.

**Message ID: 2233**

#### Abbreviated ASCII Syntax:

```
USERI2CWRITE DeviceAddress RegisterAddressLen RegisterAddress
WriteDataLength WriteData [TransactionID]
```

#### Examples:

```
USERI2CWRITE 70 1 AB 12 3132333435363738393A3B3C 1234
```

```
USERI2CWRITE 74 3 ABCDED 5 1234567890 1234
```

```
USERI2CWRITE 40 0 5 1234567890 1234
```

```
USERI2CWRITE 40 2 AABB 0 1234 (a dummy write)
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	USERI2CWRITE header	Command header. See Messages for more information.	-	H	0

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
2	DeviceAddress	The 7 bit address of the I2C device. Valid values 0 through 127.  For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits. There is no 0x prefix and spaces are not allowed in the string.	Uchar	1 <sup>1</sup>	H
3	RegisterAddressLen	The length of the register address that follows. Valid values are 0 through 4.	Ulong	4	H+4
4	RegisterAddress	The actual address of the register to be written. The number of bytes here must match the RegisterAddressLen. In particular, when RegisterAddressLen is 0, this field is empty (even for a binary command)  For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits for each byte in the register address. There is no 0x prefix and spaces are not allowed in the string.	Uchar Array	X <sup>1</sup>	H+8
5	WriteDataLength	The length of data to be written in bytes. Valid values are 0 through 256.	Ulong	4	H+12 <sup>2</sup>
6	WriteData	The data to be written. The number of bytes in this data block must match the WriteDataLength. In particular, when WriteDataLength is 0, this field is empty.  For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits for each byte in the data block. There is no 0x prefix and spaces are not allowed in the string.  Data is streamed to the device as a series of bytes in the order provided.	Uchar Array	Y <sup>3</sup>	H+16 <sup>4</sup>
7	TransactionID	An optional user provided ID for this transaction. Default = 0.  This transaction ID will be copied to the <b>USERI2CRESPONSE</b> log (see page 865) created for this write operation.	Ulong	4	H+16+4*INT((Y+3)/4) <sup>5</sup>

<sup>1</sup>In the binary case, additional bytes of padding are added after this field to maintain 4-byte alignment for the fields that follow.

<sup>2</sup>H+8 if X=0

<sup>3</sup>In the binary case, additional bytes of padding are added after this field to maintain 4-byte alignment for the fields that follow.

<sup>4</sup>H+12 if X=0

<sup>5</sup>H+12+4\*INT((Y+3)/4) if X=0

## 2.194 UTMZONE

### Sets UTM parameters

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command sets the UTM persistence, zone number or meridian. Refer to [earth-info.nga.mil/GandG/coordsys/grids/referencesys.html](http://earth-info.nga.mil/GandG/coordsys/grids/referencesys.html) for more information and a world map of UTM zone numbers.

1. The latitude limits of the UTM System are 80°S to 84°N, so if your position is outside this range, the **BESTUTM** log (see page 441) outputs a northing, easting and height of 0.0, along with a zone letter of "\*" and a zone number of 0, so that it is obvious that the data in the log is dummy data.
2. If the latitude band is X, then the Zone number should not be set to 32, 34 or 36. These zones were incorporated into other zone numbers and do not exist.

**Message ID:** 749

#### Abbreviated ASCII Syntax:

```
UTMZONE command [parameter]
```

#### Factory Default:

```
UTMZONE auto 0
```

#### ASCII Example 1:

```
UTMZONE SET 10
```

#### ASCII Example 2:

```
UTMZONE CURRENT
```

The UTM grid system is displayed on all National Topographic Series (NTS) of Canada maps and United States Geological Survey (USGS) maps. On USGS 7.5-minute quadrangle maps (1:24,000 scale), 15-minute quadrangle maps (1:50,000, 1:62,500, and standard-edition 1:63,360 scales) and Canadian 1:50,000 maps the UTM grid lines are drawn at intervals of 1,000 meters and are shown either with blue ticks at the edge of the map or by full blue grid lines. On USGS maps at 1:100,000 and 1:250,000 scale and Canadian 1:250,000 scale maps a full UTM grid is shown at intervals of 10,000 meters.

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	UTMZONE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	command	See <i>Table 75: UTM Zone Commands</i> on the next page			Enum	4	H
3	parameter	See <i>Table 75: UTM Zone Commands</i> on the next page			Long	4	H+4

Table 75: UTM Zone Commands

Binary	ASCII	Description
0	AUTO	UTM zone default that automatically sets the central meridian and does not switch zones until it overlaps by the set persistence. This a spherical approximation to the earth unless you are at the equator (default = 0) (m)
1	CURRENT	Same as UTMZONE AUTO with infinite persistence of the current zone. The parameter field is not used
2	SET	Sets the central meridian based on the specified UTM zone. A zone includes its western boundary, but not its eastern boundary, Meridian. For example, zone 12 includes (108°W, 114°W) where $108^\circ < \text{longitude} < 114^\circ$
3	MERIDIAN	Sets the central meridian as specified in the parameter field. In the <b>BESTUTM</b> log (see page 441), the zone number is output as 61 to indicate the manual setting (zones are set by pre-defined central meridians not user-set ones)

## 2.195 WIFIALIGNAUTOMATION

### Configure the ALIGN plug-and-play feature over Wi-Fi

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to simplify the configuration of a pair of receivers; one acting as an ALIGN Master and the other acting as an ALIGN Rover.

Similar to the **ALIGNAUTOMATION** command (see page 63) the ALIGN Rover, acting as a Wi-Fi Client, connects to the specified Wi-Fi Access Point and configures it as an ALIGN Master.

The IP address of the ALIGN Rover and ALIGN Master must be different. Since all NovAtel receivers are delivered with the same default IP address, it is highly recommended to use the **WIFIPIPCONFIG** command (see page 393) to change the IP address of the ALIGN Rover to a non-default value such as 192.168.20.1 prior to entering the **WIFIALIGNAUTOMATION** command. Failure to do so may result in loss of wireless communication to the ALIGN Rover.

**Message ID: 2214**

#### Abbreviated ASCII Syntax:

```
WIFIALIGNAUTOMATION option [master_networkid] [corrections_port] [datarate]
[headingextboption] [interfacemode]
```

#### Factory Default:

```
WIFIALIGNAUTOMATION DISABLE
```

#### Example:

```
WIFIALIGNAUTOMATION enable 1 icom1 10 on novatelx
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFIALIGN AUTOMATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	ENABLE	1	Enable or disable the plug-and-play feature.	Enum	4	H
		DISABLE	0				
3	master_network	1-4		Network id of Align Master Access Point as defined in the <b>WIFINETCONFIG</b> command (see page 397).	Ulong	4	H+4

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
4	corrections_port	ICOM1	23	Name of ICOM port to be used by Rover and Master. <b>Caution:</b> The Master ICOM port must be configured with factory default settings. (default=ICOM1)	Enum	4	H+8
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
5	datarate	1, 2, 4, 5, 10 or 20		Rate (in Hz) at which heading output is required (default = ICOM1)	Ulong	4	H+12
6	headingextboption	OFF	0	Enable or disable sending HEADINGEXTB / HEADINGEXT2B back to Master (default=ON)	Enum	4	H+16
		ON	1				
7	interfacemode	see See Table 44: Serial Port Interface Modes below on page 191		Interfacemode for corrections (default = NONE)  If this parameter is not specified, the ALIGN Master is not configured to generate any corrections. The assumption is that the master has been separately configured. Refer to ALIGN Over Wi-Fi Overview in the <a href="#">PwrPak7 Installation and Operation User Manual</a> for details on ALIGN.	Enum	4	H+20

## 2.196 WIFIAPCHANNEL

### *Set the channel for the Wi-Fi access point*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to set the operating channel for the Wi-Fi module when operating as an access point. The new channel will be used the next time the **WIFIMODE AP** or **WIFIMODE CONCURRENT** command is received.

**Message ID: 2091**

**Abbreviated ASCII Syntax:**

```
WIFIAPCHANNEL channel
```

**Factory Default:**

```
WIFIAPCHANNEL 11
```

**Example:**

```
WIFIAPCHANNEL 6
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Value	Binary Offset
1	WIFIAPCHANNEL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	channel	1-14		802.11 channel	Long	4	H

For best performance, choose one of the non-overlapping channels: 1, 6, or 11.

## 2.197 WIFIAPIPCONFIG

**Set the IP address and netmask for the Wi-Fi access point**

**Platform:** PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to set the Wi-Fi IP address and netmask for Wi-Fi module when operating as an access point. The new network configuration takes effect the next time the **WIFIMODE AP** or **WIFIMODE CONCURRENT** command is received.

**Message ID: 2096**

**Abbreviated ASCII Syntax:**

```
WIFIAPIPCONFIG ip_address ip_netmask
```

**Factory Default:**

```
WIFIAPIPCONFIG 192.168.19.1 255.255.255.0
```

**Example:**

```
WIFIAPIPCONFIG 192.162.55.20 255.255.0.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFIAPIPCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	ip_address	Null-terminated ASCII string		IP address, dot decimal format	String [16]	Variable	H
3	ip_netmask	Null-terminated ASCII string		IP netmask, dot decimal format (optional) Default =255.255.255.0	String [16]	Variable	Variable

## 2.198 WIFIAPPASSKEY

### *Set Wi-Fi access point passkey*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to set the WPA2 PSK ASCII passkey for the Wi-Fi module when the receiver is operating as an Access Point.

The default passkey is printed on the receiver label.

The new passkey takes effect the next time the **WIFIMODE AP** or **WIFIMODE CONCURRENT** command is received.

The term passkey and password are the same.

**Message ID: 2090**

#### **Abbreviated ASCII Syntax:**

```
WIFIAPPASSKEY passkey
```

#### **Factory Default:**

The default passkey/password is printed on the receiver label.

#### **Example:**

```
WIFIAPPASSKEY "bysP3ze6SZmFQeyd"
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFIAPPASSKEY header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	passkey	Null-terminated ASCII string, 8 to 64 characters		WPA2 PSK ASCII passkey	String [65]	Variable	H

## 2.199 WIFIAPSSID

### *Set the SSID for the Wi-Fi access point*

**Platform:** PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to explicitly set the SSID of the Access Point when the receiver is configured to operate in either AP or CONCURRENT mode (refer to the **WIFIMODE** command on the next page for details regarding the Wi-Fi configuration modes).

**Message ID:** 2206

**Abbreviated ASCII Syntax:**

```
WIFIAPSSID ssid
```

**Factory Default:**

```
<platform-dependent prefix>-<Enclosure PSN>
```

**Example:**

```
PwrPak7-NMND17190003B
```

```
SM7i-NMPX17500010L
```

**Example:**

```
WIFIAPSSID SomeSSIDName
```

```
WIFIAPSSID "SSID with spaces"
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFIAPSSID header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	SSID	Null-terminated ASCII string		SSID to be broadcast by access point	String [33]	Variable	H

## 2.200 WIFIMODE

### Configure the receiver Wi-Fi mode

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to enable, disable or set the operating mode of Wi-Fi on the receiver. This command is also applies any Wi-Fi configuration changes specified by other Wi-Fi commands such as **WIFIAPCHANNEL**.

**Message ID: 2144**

#### Abbreviated ASCII Syntax:

```
WIFIMODE mode
```

#### Factory Default:

```
WIFIMODE AP
```

#### Example:

```
WIFIMODE CLIENT
```

```
WIFIMODE OFF
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFIMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	OFF	0	Power off the Wi-Fi module	Enum	4	H
		AP	1	Configure the Wi-Fi module as an Access Point (AP)			
		CLIENT	2	Configure the Wi-Fi module as a Client/Station			
		ON	3	Supply power to the Wi-Fi module, but do not configure it.			
		CONCURRENT	4	Configure the Wi-Fi module as both an access point and Client/Station simultaneously. When configured in this mode it is possible to connect the receiver to an access point and for Clients/Stations to connect to the receiver simultaneously.			

## 2.201 WIFINETCONFIG

*Set the connection parameters of Wi-Fi to which the Wi-Fi client can connect*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this command to specify Access Points (AP) to which the Client/Station will automatically connect when the receiver's Wi-Fi Client/Station functionality is enabled (refer to the **WIFIMODE** command (see page 396) for details regarding the Wi-Fi configuration modes).

If the Wi-Fi Client/Station is already connected to an access point (defined using this command), the connection remains in effect even when a more preferred access point comes into range (preferred as indicated by `network_id`).

If Wi-Fi ALIGN automation is enabled, the Client only connects to the Access Point specified in the **WIFIALIGNAUTOMATION** command (see page 390).

The term passkey and password are the same.

**Message ID: 2213**

**Abbreviated ASCII Syntax:**

```
WIFINETCONFIG network_id switch [ssid [passkey [address_mode [IP_address
]netmask [gateway [dns]]]]]]]]
```

**Factory Default:**

```
WIFINETCONFIG 1 DISABLE
WIFINETCONFIG 2 DISABLE
WIFINETCONFIG 3 DISABLE
WIFINETCONFIG 4 DISABLE
```

**Example:**

```
WIFINETCONFIG 1 ENABLE SomeSSID 12345678
WIFINETCONFIG 2 ENABLE AnotherSSID 1A2b3C4d STATIC 192.168.19.1
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	WIFINETCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	network_id	1, 2, 3, 4		The Network identifier value is used to prioritize network connections when more than one network is in range of the client. The access point with the lowest network_id is chosen.	Ulong	4	H
3	switch	DISABLE	0	When set to Disable, the client will not connect to an access point with this SSID.	Enum	4	H+4
		ENABLE	1	When set to Enable, the client connects to an access point with this SSID if there are no other APs with a lower network_id in range.			
4	ssid	Null-terminated ASCII string		Access Points with non-ASCII SSIDs are not supported. Required if switch is set to ENABLE.	String [33]	Variable	
5	passkey	Null-terminated ASCII string, 8 to 64 characters		Passkey required to connect to access point identified by "ssid" parameter. (default = "")	String [65]	Variable	
6	address_mode	DHCP	1	Use dynamic IP address (default = DHCP)	Enum	4	
		STATIC	2	Use static IP address			
7	ip_address	ddd.ddd.ddd.ddd		IP Address - decimal dot notation The IP address is mandatory when the address mode is STATIC.	String [16]	Variable	
8	netmask	ddd.ddd.ddd.ddd		Netmask – decimal dot notation (default = 255.255.255.0)	String [16]	Variable	
9	gateway	ddd.ddd.ddd.ddd		Gateway – decimal dot notation (default = 0.0.0.0)	String [16]	Variable	
10	dns	ddd.ddd.ddd.ddd		DNS server – decimal dot notation (default = 0.0.0.0)	String [16]	Variable	

# Chapter 3 Logs

## 3.1 Log Types

See the **LOG** command on page 215, for details about requesting logs.

The receiver is capable of generating three type of logs: synchronous, asynchronous and polled. The data for synchronous logs is generated on a regular schedule. In order to output the most current data as soon as it is available, asynchronous data is generated at irregular intervals. The data in polled logs is generated on demand. The following table outlines the log types and the valid triggers to use:

**Table 76: Log Type Triggers**

Type	Recommended Trigger	Illegal Trigger
Synch	ONTIME	ONNEW, ONCHANGED
Asynch	ONCHANGED or ONCE	-
Polled	ONCE or ONTIME <sup>1</sup>	ONNEW, ONCHANGED

See *Message Time Stamps* on page 50 for information about how the message time stamp is set for each type of log.

1. The OEM7 family of receivers can handle 80 logs at a time. If an attempt is made to log more than 80 logs at a time, the receiver responds with an Insufficient Resources error.
2. Asynchronous logs, such as MATCHEDPOS, should only be logged ONCHANGED. Otherwise, the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may result in inaccurate time tags.
3. Use the ONNEW trigger with the MARKxTIME or MARKxPOS logs.
4. Before the output of fields for logs, there is a header. See *ASCII* on page 31, *Abbreviated ASCII* on page 33 and *Binary* on page 33.

### 3.1.1 Log Type Examples

For polled logs, the receiver only supports an offset that is:

- smaller than the logging period
- decimal values that are a multiple of the maximum logging rate defined by the receiver model. For more information see the **LOG** command on page 215.

The following are valid examples for a polled log:

```
log portstats ontime 4 2
log version once
```

For polled logs, the following examples are invalid:

```
log serialconfig ontime 1 2      [offset is larger than the logging period]
log serialconfig ontime 4 1.5    [offset is not an integer]
```

<sup>1</sup>Polled log types do not allow fractional offsets and cannot do ontime rates faster than 1 Hz.

For synchronous and asynchronous logs, the receiver supports any offset that is both:

- smaller than the logging period
- a multiple of the minimum logging period

For example, if the receiver supports 20 Hz logging, the minimum logging period is 1/20 Hz or 0.05 s. The following are valid examples for a synchronous or asynchronous log, on a receiver that can log at rates up to 20 Hz:

```
log bestpos ontime 1          [1 Hz]
log bestpos ontime 1 0.1
log bestpos ontime 1 0.90
log avepos ontime 1 0.95
log avepos ontime 2          [0.5 Hz]
log avepos ontime 2 1.35
log avepos ontime 2 1.75
```

For synchronous and asynchronous logs, the following examples are invalid:

```
log bestpos ontime 1 0.08    [offset is not a multiple of the minimum logging period]
log bestpos ontime 1 1.05    [offset is larger than the logging period]
```

## 3.2 ALIGNBSLNENU

### *ENU baselines using ALIGN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log outputs the RTK quality ENU baselines from ALIGN. The XYZ baselines (output in the **ALIGNBSLNXYZ** log on page 403) are rotated relative to master position (output in MASTERPOS) to compute ENU baselines.

On dual antenna receivers, the baseline vector from the primary to the secondary antenna is provided. Additionally, with an ALIGN Relative Positioning model, the baseline vector from an external base station to the primary antenna is also available. The baseline vector from an external base station to the secondary antenna is not available.

**Message ID:** 1315

**Log Type:** Asynch

**Recommended Input:**

```
log alignbslnenua onnew
```

**ASCII Example:**

```
#ALIGNBSLNENUA,COM1,0,29.0,FINESTEERING,1629,259250.000,02040000,100b,39448;
SOL_COMPUTED,NARROW_INT,4.1586,-1.9197,-0.0037,0.0047,0.0050,0.0062,"0092",
"AAAA",22,16,16,16,0,01,0,33*11e1d4c0
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	ALIGNBSLNENU header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol stat	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	East	East Baseline (relative to master position) in meters	Double	8	H+8
5	North	North Baseline (relative to master position) in meters	Double	8	H+16
6	Up	Up Baseline (relative to master position) in meters	Double	8	H+24
7	East $\sigma$	East Baseline standard deviation in meters	Float	4	H+32
8	North $\sigma$	North Baseline standard deviation in meters	Float	4	H+36
9	Up $\sigma$	Up Baseline standard deviation in meters	Float	4	H+40

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	Rover id	Rover Receiver ID Set using the <b>SETROVERID</b> command (see page 333) on the Rover e.g., setroverid RRRR	Char[4]	4	H+44
11	Master id	Master Receiver ID Set using the <b>DGPSTXID</b> command (see page 124) on the Master Default: AAAA	Char[4]	4	H+48
12	#SVs	Number of satellites tracked	Uchar	1	H+52
13	#solnSVs	Number of satellites used in solution	Uchar	1	H+53
14	#obs	Number of satellites above elevation mask angle	Uchar	1	H+54
15	#multi	Number of satellites with multi-frequency signals above the mask angle	Uchar	1	H+55
16	Reserved		Hex	1	H+56
17	ext sol stat	Extended solution status, see <i>Table 84: Extended Solution Status</i> on page 436	Hex	1	H+57
18	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+58
19	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+59
20	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+60
21	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

### 3.3 ALIGNBSLNXYZ

#### *XYZ baselines using ALIGN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log outputs the RTK quality XYZ baselines from ALIGN.

On dual antenna receivers, the baseline vector from the primary to the secondary antenna is provided. Additionally, with an ALIGN Relative Positioning model, the baseline vector from an external base station to the primary antenna is also available. The baseline vector from an external base station to the secondary antenna is not available.

**Message ID:** 1314

**Log Type:** Asynch

**Recommended Input:**

```
log alignbslnxyza onnew
```

**ASCII Example:**

```
#ALIGNBSLNXYZA, COM1, 0, 29.0, FINESTEERING, 1629, 259250.000, 02040000, 9d28, 39448;
SOL_COMPUTED, NARROW_INT, 3.1901, -3.0566, 1.2079, 0.0050, 0.0054, 0.0056, "0092",
"AAAA", 22, 16, 16, 16, 0, 01, 0, 33*ac372198
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	ALIGNBSLNXYZ header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol stat	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	dX	X Baseline in meters	Double	8	H+8
5	dY	Y Baseline in meters	Double	8	H+16
6	dZ	Z Baseline in meters	Double	8	H+24
7	dX $\sigma$	X Baseline standard deviation in meters	Float	4	H+32
8	dY $\sigma$	Y Baseline standard deviation in meters	Float	4	H+36
9	dZ $\sigma$	Z Baseline standard deviation in meters	Float	4	H+40

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	Rover id	Rover Receiver ID Set using <b>SETROVERID</b> command (see page 333) on the Rover e.g. SETROVERID RRRR	Uchar [4]	4	H+44
11	Master id	Master Receiver Id Set using the <b>DGPSTXID</b> command (see page 124) on the Master Default: AAAA	Uchar [4]	4	H+48
12	#SVs	Number of satellites tracked	Uchar	1	H+52
13	#solnSVs	Number of satellites used in solution	Uchar	1	H+53
14	#obs	Number of satellites above elevation mask angle	Uchar	1	H+54
15	#multi	Number of satellites with multi-frequency signals above the mask angle	Uchar	1	H+55
16	Reserved		Hex	1	H+56
17	ext sol stat	Extended solution status, see <i>Table 84: Extended Solution Status</i> on page 436	Hex	1	H+57
18	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+58
19	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+59

21	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 3.4 ALIGNDOP

### *Calculated DOP values*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log outputs the DOP computed using the satellites used in the heading solution. This log comes out at a default 1 Hz rate. Additional logs may be output not on the even second if the DOP changes and ALIGN is operating at greater than 1 Hz.

**Message ID:** 1332

**Log Type:** Asynch

**Recommended Input:**

```
log aligndopa onnew
```

**ASCII Example:**

```
#ALIGNDOPA, COM1, 0, 22.5, FINESTEERING, 1629, 259250.000, 02040000, de2d, 39448; 1.6160,
1.2400, 0.6900, 0.9920, 0.7130, 10.0, 16, 4, 32, 23, 10, 7, 20, 13, 30, 16, 47, 43, 46, 53, 54, 44,
45*90a72971
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	ALIGNDOP header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	GDOP	Geometric DOP	Float	4	H
3	PDOP	Position DOP	Float	4	H+4
4	HDOP	Horizontal DOP	Float	4	H+8
5	HTDOP	Horizontal and time DOP	Float	4	H+12
6	TDOP	GPS time DOP	Float	4	H+16
7	Elev mask	Elevation mask angle	Float	4	H+20
8	#sats	Number of satellites to follow	Ulong	4	H+24
9	sats	Satellites in use at time of calculation	Ulong	4	H+28
10	Next sat offset = H+28+(#sats * 4)				
11	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+28+ (#sats * 4)
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.5 ALMANAC

### *Decoded GPS L1 C/A Almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the decoded GPS almanac parameters from L1 C/A subframes four and five, as received from the satellite, with the parity information removed and appropriate scaling applied. For more information about almanac data, refer to the GPS SPS Signal Specification.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

**Message ID:** 73

**Log Type:** Asynch

**Recommended Input:**

```
log almanaca onchanged
```

**ASCII Example:**

```
#ALMANACA, COM1, 0, 81.5, SATTIME, 2061, 161544.000, 02000020, 06de, 15340;

```

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	ALMANAC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#messages	The number of satellite PRN almanac messages to follow. Set to zero until almanac data is available	Long	4	H
3	PRN	Satellite PRN number for current message (dimensionless)	Ulong	4	H+4
4	week	Almanac reference week (GPS reference week number)	Ulong	4	H+8
5	seconds	Almanac reference time (seconds into the week)	Double	8	H+12
6	ecc	Eccentricity (dimensionless)	Double	8	H+20
7	$\dot{\omega}$	Rate of right ascension (radians/second)	Double	8	H+28
8	$\omega_0$	Right ascension (radians)	Double	8	H+36
9	$\omega$	Argument of perigee (radians)	Double	8	H+44
10	$M_0$	Mean anomaly of reference time (radians)	Double	8	H+52
11	$a_{f0}$	Clock aging parameter (seconds)	Double	8	H+60
12	$a_{f1}$	Clock aging parameter (seconds/second)	Double	8	H+68
13	$N_0$	Computed mean motion (radians/second)	Double	8	H+76
14	A	Semi-major axis (meters)	Double	8	H+84
15	incl-angle	Angle of inclination relative to $0.3\pi$ (radians)	Double	8	H+92
16	SV config	Satellite configuration	Ulong	4	H+100
17	health-prn	SV health from Page 25 of subframe 4 or 5 (6 bits)	Ulong	4	H+104
18	health-alm	SV health from almanac (8 bits)	Ulong	4	H+108
19	antispoof	Anti-spoofing on? 0 = FALSE 1 = TRUE	Bool	4	H+112
20...	Next PRN offset = $H + 4 + (\#messages \times 112)$				
21	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	$H + 4 + (112 \times \#messages)$
22	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.6 AUTHCODES

### *List of authorization codes*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains all authorization codes (auth codes) entered into the system since the last complete firmware reload. Signature authorization codes will be maintained through a SoftLoad. The log also indicates the status of the firmware signature. For more information about firmware signatures see the “Upgrading Using the AUTH Command” section of the [OEM7 Installation and Operation User Manual](#).

The following situations will cause an authorization code to be marked invalid:

- Authorization Code is for a different receiver
- Authorization Code has expired
- Authorization Code was entered incorrectly

If you require new authorization codes, contact NovAtel Customer Service.

**Message ID:** 1348

**Log Type:** Polled

**Recommended Input:**

```
log authcodesa once
```

**ASCII Example:**

```
#AUTHCODESA,COM1,0,80.5,UNKNOWN,0,10.775,024c0000,2ad2,12143;VALID,2,SIGNATURE,TRUE,"63F3K8,MX43GD,T4BJ2X,924RRB,BZRWB,T,D2SB0G550",STANDARD,TRUE,"CJ43M9,2RNDBH,F3PDK8,N88F44,8JMKK9,D2SB0G550"*6f778e32
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	AUTHCODES header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	AUTHCODES Signature Status	Status of the Firmware Signature 1 = NONE 2 = INVALID 3 = VALID 4 = RESERVED 5 = HIGH_SPEED	Enum	4	H
3	Number of Auth Codes	# of Auth Codes to follow (max is 24)	Ulong	4	H+4

Field	Field type	Description	Format	Binary Bytes	Binary Offset
4	Auth code type	1=STANDARD 2=SIGNATURE 3=EMBEDDED	Enum	4	H+8
5	Valid	TRUE if the Auth Code has been verified	Bool	4	H+12
6	Auth Code String	ASCII String of the Auth Code	String [max 80]	variable <sup>1</sup>	H+16
7...	Next AuthCode = H+8+ (#AuthCodes*variable)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+8+ (#AuthCodes* variable)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 3.7 AVEPOS

### *Position averaging*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

When position averaging is underway, the various fields in the AVEPOS log contain the parameters being used in the position averaging process. *Table 77: Position Averaging Status* on the next page shows the possible position averaging status values seen in field #8 of the AVEPOS log table.

See the description of the **POSAVE** command on page 252. For general positioning information, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

Asynchronous logs should only be logged ONCHANGED. Otherwise, the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

**Message ID:** 172

**Log Type:** Asynch

**Recommended Input:**

```
log aveposa onchanged
```

**ASCII Example:**

```
#AVEPOSA, COM1, 0, 48.5, FINESTEERING, 1364, 492100.000, 82000000, e3b4, 2310;  
51.11635589900, -114.03833558937, 1062.216134356, 1.7561, 0.7856, 1.7236,  
INPROGRESS, 2400, 2*72a550c1
```

When a GNSS position is computed, there are four unknowns being solved: latitude, longitude, height and receiver clock offset (often just called time). The solutions for each of the four unknowns are correlated to satellite positions in a complex way. Since satellites are above the antenna (none are below) there is a geometric bias. Therefore, geometric biases are present in the solutions and affect the computation of height. These biases are called DOPs (Dilution Of Precision). Smaller biases are indicated by low DOP values. VDOP (Vertical DOP) pertains to height. Most of the time, VDOP is higher than HDOP (Horizontal DOP) and TDOP (Time DOP). Therefore, of the four unknowns, height is the most difficult to solve. Many GNSS receivers output the Standard Deviations (SD) of the latitude, longitude and height. Height often has a larger value than the other two.

Accuracy is based on statistics and reliability is measured in percent. When a receiver states it can measure height to one meter, this is an accuracy. Usually this is a one sigma value (one SD). A one sigma value for height has a reliability of 68%. In other words, the error is less than one meter 68% of the time. For a more realistic accuracy, double the one sigma value (one meter) and the result is 95% reliability (error is less than two meters 95% of the time). Generally, GNSS heights are 1.5 times poorer than horizontal positions. See also **GPGST** log on page 532 for CEP and RMS definitions.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	AVEPOS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	lat	Average WGS84 latitude (degrees)	Double	8	H
3	lon	Average WGS84 longitude (degrees)	Double	8	H+8
4	hgt	Average height above sea level (m)	Double	8	H+16
5	lat $\sigma$	Estimated average standard deviation of latitude solution element (m)	Float	4	H+24
6	lon $\sigma$	Estimated average standard deviation of longitude solution element (m)	Float	4	H+28
7	hgt $\sigma$	Estimated average standard deviation of height solution element (m)	Float	4	H+32
8	posave	Position averaging status (see <i>Table 77: Position Averaging Status</i> below)	Enum	4	H+36
9	ave time	Elapsed time of averaging (s)	Ulong	4	H+40
10	#samples	Number of samples in the average	Ulong	4	H+44
11	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+48
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 77: Position Averaging Status

Binary	ASCII	Description
0	OFF	Receiver is not averaging
1	INPROGRESS	Averaging is in progress
2	COMPLETE	Averaging is complete

## 3.8 BDSALMANAC

### *Decoded BDS Almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the decoded BeiDou B1I almanac parameters, with the parity information removed and appropriate scaling applied. Multiple messages are transmitted, one for each SV almanac collected. For more information about almanac data, refer to the BDS Signal Specification.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

**Message ID:** 1584

**Log Type:** Asynch

**Recommended Input:**

```
log bdsalmanaca onchanged
```

**ASCII Example:**

```
#BDSALMANACA, COM1, 13, 88.5, SATTIME, 1727, 518438.000, 02000000, 24ad, 44226;1, 371,

```

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BDSALMANAC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	satellite ID	Satellite ID/ranging code	Ulong	4	H
3	week	BeiDou week number	Ulong	4	H+4
4	toa	Time of almanac (s)	Ulong	4	H+8
5	RootA	Square root of semi-major axis (sqrt(m))	Double	8	H+12
6	ecc	Eccentricity (dimensionless)	Double	8	H+20
7	$\omega$	Argument of perigee (radians)	Double	8	H+28

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	$M_0$	Mean anomaly at reference time (radians)	Double	8	H+36
9	$\Omega$	Longitude of ascending node of orbital of plane computed according to reference time (radians)	Double	8	H+44
10	$\dot{\Omega}$	Rate of right ascension (radians/s)	Double	8	H+52
11	$\delta_i$	Correction of orbit reference inclination at reference time (radians)	Double	8	H+60
12	$a_0$	Constant term of clock correction polynomial (s)	Double	8	H+68
13	$a_1$	Linear term of clock correction polynomial (s/s)	Double	8	H+76
14	health	Satellite health information	Ulong	4	H+84
15	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+88
16	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.9 BDSBCNAV1EPHEMERIS

### *Decoded BeiDou B-CNAV1 ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log provides the decoded BeiDou B-CNAV1 ephemeris for the BeiDou B1C signal.

**Message ID:** 2371

**Log Type:** Asynch

**Recommended Input:**

```
log bdsbcnavlephemerisa onchanged
```

**Example log:**

```
#BDSBCNAV1EPHEMERISA,USB3,0,7.5,SATTIME,2098,306194.000,03000020,63a7,32768;

## 3.10 BDSBCNAV2EPHEMERIS

### *Decoded BDS B-CNAV2 ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log provides the Decoded BDS B-CNAV2 ephemeris for the BDS B2a Signal.

**Message ID:** 2372

**Log Type:** Asynch

**Recommended Input:**

```
log bdsbcnav2ephemerisa onchanged
```

**Example log:**

```
#BDSBCNAV2EPHEMERISA,USB3,0,7.5,SATTIME,2098,306194.000,03000020,639f,32768;

## 3.11 BDSLOCK

### *BeiDou time parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains time parameters transmitted by the BeiDou satellites. These parameters can be used to calculate the offset between BeiDou time (BDT) and other time frames.

**Message ID:** 1607

**Log Type:** Asynch

**Recommended Input:**

```
log bdslocka onchanged
```

**ASCII Example:**

```
#BDSLOCKA, COM1, 0, 80.0, SATTIME, 1730, 193994.000, 02000000, 3b16, 44290;

## 3.12 BDSEPHEMERIS

### *Decoded BDS ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains a single set of BDS B1I ephemeris parameters with appropriate scaling applied. Multiple messages are transmitted, one for each SV ephemeris collected.

**Message ID:** 1696

**Log Type:** Asynch

**Recommended Input:**

```
log bdsephemerisa onchanged
```

**ASCII Example:**

```
#BDSEPHEMERISA, COM1, 0, 82.5, SATTIME, 1774, 162464.000, 02000000, 2626, 45436;

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
13	AODE	Age of data, ephemeris	Ulong	4	H+68
14	toe	Reference time of ephemeris parameters (s)	Ulong	4	H+72
15	RootA	Square root of semi-major axis (sqrt(m))	Double	8	H+76
16	ecc	Eccentricity (dimensionless)	Double	8	H+84
17	$\omega$	Argument of perigee (radians)	Double	8	H+92
18	$\Delta N$	Mean motion difference from computed value (radians/s)	Double	8	H+100
19	$M_0$	Mean anomaly at reference time (radians)	Double	8	H+108
20	$\Omega_0$	Longitude of ascending node of orbital of plane computed according to reference time (radians)	Double	8	H+116
21	$\dot{\Omega}$	Rate of right ascension (radians/s)	Double	8	H+124
22	$i_0$	Inclination angle at reference time (radians)	Double	8	H+132
23	IDOT	Rate of inclination angle (radians/second)	Double	8	H+140
24	$c_{uc}$	Amplitude of cosine harmonic correction term to the argument of latitude (radians)	Double	8	H+148
25	$c_{us}$	Amplitude of sine harmonic correction term to the argument of latitude (radians)	Double	8	H+156
26	$c_{rc}$	Amplitude of cosine harmonic correction term to the orbit radius (m)	Double	8	H+164
27	$c_{rs}$	Amplitude of sine harmonic correction term to the orbit radius (m)	Double	8	H+172
28	$c_{ic}$	Amplitude of cosine harmonic correction term to the angle of inclination (radians)	Double	8	H+180
29	$c_{is}$	Amplitude of sine harmonic correction term to the angle of inclination (radians)	Double	8	H+188
30	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+196
31	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.13 BDSIONO

#### *BeiDou Klobuchar ionosphere delay model*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the Klobuchar ionosphere model parameters transmitted by the BeiDou satellites.

**Message ID:** 1590

**Log Type:** Asynch

**Recommended Input:**

```
log bdsionoa onchanged
```

**ASCII Example:**

```
#BDSIONOA,COM1,0,80.0,SATTIME,1734,58094.000,02080000,1956,44836;6,

```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BDSIONO Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	ID	Transmitting satellite ID	Ulong	4	H
3	$\alpha_0$	Alpha parameter constant term	Double	8	H+4
4	$\alpha_1$	Alpha parameter 1st order term	Double	8	H+12
5	$\alpha_2$	Alpha parameter 2nd order term	Double	8	H+20
6	$\alpha_3$	Alpha parameter 3rd order term	Double	8	H+28
7	$\beta_0$	Beta parameter constant term	Double	8	H+36
8	$\beta_1$	Beta parameter 1st order term	Double	8	H+44
9	$\beta_2$	Beta parameter 2nd order term	Double	8	H+52
10	$\beta_3$	Beta parameter 3rd order term	Double	8	H+60
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+68
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.14 BDSRAWNAVSUBFRAME

### *Raw BeiDou subframe data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw BeiDou subframe data with parity bits removed. Only subframes that have passed the parity check are output.

**Message ID:** 1695

**Log Type:** Asynch

**Recommended Input:**

```
log bdsrawnavsubframea onchanged
```

**ASCII Example:**

```
#BDSRAWNAVSUBFRAMEA,COM1,0,85.5,SATTIME,1774,162554.000,02000000,88f3,45436;84,13,B1D1,1,e24049ebb2b00d113c685207c4d0ee9fd1bf364e41f8f4b57003268c*6b1f478b
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BDSRAWNAVSUBFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	signal channel	Signal channel number	Ulong	4	H
3	satellite ID	Satellite ID	Ulong	4	H+4
4	data source	Source of data (refer to <i>Table 78: Data Source</i> below)	Enum	4	H+8
5	subframe ID	Subframe identifier	Ulong	4	H+12
6	raw subframe data	Framed raw navigation bits	Hex [28]	28	H+16
7	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+44
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 78: Data Source**

ASCII	Binary	Description
B1D1	0	Data is from a B1I/D1 signal
B1D2	1	Data is from a B1I/D2 signal
B2D1	65536	Data is from a B2I/D1 signal
B2D2	65537	Data is from a B2I/D2 signal

## 3.15 BESTDATUMINFO

### *Datum information for best position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **BESTPOS** log (see page 429). For differential solutions, such as RTK or PSRDIFF, where the base station datum is not known, "UNKNOWN" is reported with an EPSG code of 0. Single-point and SBAS report "ECEF" and code 0.

**Message ID:** 2305

**Log Type:** Asynch

**Recommended Input:**

```
log bestdatuminfoa onchanged
```

**ASCII Example:**

```
#BESTDATUMINFOA,COM1,0,62.5,FINESTEERING,2044,508765.000,02000020,0c2b,15427;  
"ITRF2014",1165,2019.202,GOOD*3db57b92
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BESTDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the <b>BESTPOS</b> log.	Char [32]	variable	H
3	epsg_code	EPSG code of the datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year). Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation status. See <i>Table 79: Transformation Status</i> below.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

**Table 79: Transformation Status**

Binary	ASCII	Description
0	GOOD	An exact transformation was found and used.

Binary	ASCII	Description
1	ECEF_EQUIVALENCY	An exact transformation could not be found, but a similar transformation involving another Earth-fixed transformation was found and used.
2	SERVICE_DETAILS_UNKNOWN	The datum of the input solution was not known and therefore a transformation could not take place.
3	REQUESTED_TRANSFORMATION_UNAVAILABLE	No transformation could be found to transform the solution into the requested datum.

## 3.16 BESTGNSSDATUMINFO

### *Datum information for BESTGNSS position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **BESTGNSSPOS** log (see page 934). For differential solutions, such as RTK or PSRDIFF, where the base station datum is not known, "UNKNOWN" is reported with an EPSG code of 0. Single-point and SBAS report "ECEF" and code 0.

**Message ID:** 2302

**Log Type:** Asynch

**Recommended Input:**

```
log bestgnssdatuminfoa onchanged
```

**ASCII Example:**

```
#BESTGNSSDATUMINFOA,COM1,0,75.0,FINESTEERING,2044,509700.000,02000020,1790,15427;"ITRF2014",1165,2019.202,GOOD*a34f668f
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BESTGNSSDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of position being output by the <b>BESTGNSSPOS</b> log.	Char [32]	variable	
3	epsg_code	EPSG code of the datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year). Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation Status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.17 BESTPOS

### *Best position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

When positioning with GNSS, there are four parameters being solved for: latitude, longitude, height and receiver clock offset from GPS time. The quality of the solution for all four parameters depends on the geometry of where the satellites are with respect to the antenna (and receiver). The strength of the positioning geometry is indicated by Dilution of Precision (DOP) values, with lower DOP numbers indicating better geometry. Because all the GNSS satellites are above terrestrial receivers, the VDOP (vertical DOP) is the largest DOP value. This is why the reported standard deviation for height is usually larger than for latitude or longitude.

Accuracy is based on statistics and reliability is measured in percentages. When a receiver states it can measure height to one meter, this is an accuracy measure. Usually this is a one sigma value (one SD). A one sigma value for height has a reliability of 68%. In other words, the error is less than one meter 68% of the time. For a more realistic accuracy, double the one sigma value (one meter) and the result is 95% reliability (error is less than two meters 95% of the time). Generally, GNSS heights are 1.5 times poorer than horizontal positions. See also the note in the **GPGST** log on page 532 for CEP and RMS definitions.

This log contains the best position computed by the receiver. In addition, it reports several status indicators, including differential age, which is useful in predicting anomalous behavior brought about by outages in differential corrections. A differential age of 0 indicates that no differential correction was used.

#### **SPAN Systems**

On systems with SPAN enabled, this log contains the best available combined GNSS and Inertial Navigation System (INS - if available) position computed by the receiver.

With the system operating in an RTK mode, BESTPOS reflects the latest low-latency solution for up to 60 seconds after reception of the last base station observation. After this 60 second period, the position reverts to the best solution available and the degradation in accuracy is reflected in the standard deviation fields. If the system is not operating in RTK mode, pseudorange differential solutions continue for the time specified in the **PSRDIFFTIMEOUT** command (see page 274). If the receiver is SPAN enabled, the GNSS+INS combined solution is also a candidate for BESTPOS output.

The RTK system in the receiver provides two kinds of position solutions. The Matched RTK position is computed with buffered observations, so there is no error due to the extrapolation of base station measurements. This provides the highest accuracy solution possible at the expense of some latency which is affected primarily by the speed of the differential data link. The **MATCHEDPOS** log (see page 607) contains the matched RTK solution and can be generated for each processed set of base station observations.

The Low-Latency RTK position is computed from the latest local observations and extrapolated base station observations. This supplies a valid RTK position with the lowest latency possible at the expense of some accuracy. The degradation in accuracy is reflected in the standard deviation and is summarized in *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss). The amount of time that the base station observations are extrapolated is in the "differential age" field of the position log. The Low-Latency RTK system extrapolates for 60 seconds. The **RTKPOS** log (see page 765) contains the Low-Latency RTK position when valid, and an "invalid" status when a Low-Latency RTK solution could not be computed. The **BESTPOS** log contains either the low-latency RTK, PPP or pseudorange-based position, whichever has the smallest standard deviation.

RTK positioning uses the carrier phase observations from the receiver. The carrier phases are precise but ambiguous: the measurement includes an unknown integer number of cycles known as the "ambiguities". Determining these ambiguities is the key to unlocking the highest-accuracy GNSS positions. This determination is known as ambiguity resolution. Before the integer ambiguities can be resolved they are first estimated as real-numbered values, "floats" in computing parlance. After some period that depends on RTK baseline length, ionosphere activity, and other observing conditions, the ambiguities can be resolved into integers, making centimeter or even sub-centimeter positioning possible.

Different positioning modes have different maximum logging rates, which are also controlled by model option. The maximum rates are: 100 Hz for RTK, 100 Hz for pseudorange based positioning, 20 Hz for GLIDE (PDP) and 20 Hz for PPP.

Under normal conditions, you should only see PENDING for a few seconds on power up before the GNSS receiver has locked onto its first few satellites. If your antenna is obstructed (or not plugged in) and you have entered a FIX POSITION command, then you may see PENDING indefinitely.</p> </div>
19	INVALID_FIX	The fixed position, entered using the <b>FIX position</b> command, is not valid
20	UNAUTHORIZED	Position type is unauthorized
21	Reserved	
22	INVALID_RATE	The selected logging rate is not supported for this solution type.

Table 81: Position or Velocity Type

Binary	ASCII	Description
0	NONE	No solution
1	FIXEDPOS	Position has been fixed by the <b>FIX position</b> command or by position averaging.
2	FIXEDHEIGHT	Position has been fixed by the <b>FIX height</b> or <b>FIX auto</b> command or by position averaging
3-7	Reserved	
8	DOPPLER_VELOCITY	Velocity computed using instantaneous Doppler
9-15	Reserved	
16	SINGLE	Solution calculated using only data supplied by the GNSS satellites
17	PSRDIFF	Solution calculated using pseudorange differential (DGPS, DGNSS) corrections
18	WAAS	Solution calculated using corrections from an SBAS satellite
19	PROPAGATED	Propagated by a Kalman filter without new observations
20-31	Reserved	
32	L1_FLOAT	Single-frequency RTK solution with unresolved, float carrier phase ambiguities
33	Reserved	

Binary	ASCII	Description
34	NARROW_FLOAT	Multi-frequency RTK solution with unresolved, float carrier phase ambiguities
35-47	Reserved	
48	L1_INT	Single-frequency RTK solution with carrier phase ambiguities resolved to integers
49	WIDE_INT	Multi-frequency RTK solution with carrier phase ambiguities resolved to wide-lane integers
50	NARROW_INT	Multi-frequency RTK solution with carrier phase ambiguities resolved to narrow-lane integers
51	RTK_DIRECT_INS	RTK status where the RTK filter is directly initialized from the INS filter
52	INS_SBAS	INS position, where the last applied position update used a GNSS solution computed using corrections from an SBAS (WAAS) solution
53	INS_PSRSP	INS position, where the last applied position update used a single point GNSS (SINGLE) solution
54	INS_PSRDIFF	INS position, where the last applied position update used a pseudorange differential GNSS (PSRDIFF) solution
55	INS_RTKFLOAT	INS position, where the last applied position update used a floating ambiguity RTK (L1_FLOAT or NARROW_FLOAT) solution
56	INS_RTKFIXED	INS position, where the last applied position update used a fixed integer ambiguity RTK (L1_INT, WIDE_INT or NARROW_INT) solution
57-67	Reserved	
68	PPP_CONVERGING	Converging TerraStar-C, TerraStar-C PRO or TerraStar-X solution
69	PPP	Converged TerraStar-C, TerraStar-C PRO or TerraStar-X solution
70	OPERATIONAL	Solution accuracy is within UAL operational limit
71	WARNING	Solution accuracy is outside UAL operational limit but within warning limit
72	OUT_OF_BOUNDS	Solution accuracy is outside UAL limits
73	INS_PPP_CONVERGING	INS position, where the last applied position update used a converging TerraStar-C, TerraStar-C PRO or TerraStar-X PPP (PPP_CONVERGING) solution
74	INS_PPP	INS position, where the last applied position update used a converged TerraStar-C, TerraStar-C PRO or TerraStar-X PPP (PPP) solution
77	PPP_BASIC_CONVERGING	Converging TerraStar-L solution

Binary	ASCII	Description
78	PPP_BASIC	Converged TerraStar-L solution
79	INS_PPP_ BASIC _CONVERGING	INS position, where the last applied position update used a converging TerraStar-L PPP (PPP_BASIC) solution
80	INS_PPP_ BASIC	INS position, where the last applied position update used a converged TerraStar-L PPP (PPP_BASIC) solution

PPP requires access to a suitable correction stream, delivered either through L-Band or the Internet. For L-Band delivered TerraStar or Veripos service, an L-Band capable receiver and software model is required, along with a subscription to the desired service. Contact NovAtel for TerraStar and Veripos subscription details.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	BESTSATS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	System	See <i>Table 118: Satellite System</i> on page 561	Enum	4	H+4

Field	Field type	Description	Format	Binary Bytes	Binary Offset
4	Satellite ID	In binary logs, the satellite ID field is 4 bytes. The 2 lowest-order bytes, interpreted as a USHORT, are the system identifier: for instance, the PRN for GPS, Galileo, BeiDou, NavIC and QZSS, or the slot for GLONASS. The 2 highest-order bytes are the frequency channel for GLONASS, interpreted as a SHORT and zero for all other systems.  In ASCII and abbreviated ASCII logs, the satellite ID field is the system identifier. If the system is GLONASS and the frequency channel is not zero, then the signed channel is appended to the system identifier. For example, slot 13, frequency channel -2 is output as 13-2.	Ulong	4	H+8
5	Status	Satellite status. See <i>Table 86: Observation Statuses</i> below	Enum	4	H+12
6	Signal mask	See <i>Table 87: GPS Signal Mask</i> on the next page, <i>Table 88: GLONASS Signal Mask</i> on the next page, <i>Table 89: Galileo Signal Mask</i> on page 440, <i>Table 90: BeiDou Signal Mask</i> on page 440, <i>Table 91: QZSS Signal Mask</i> on page 440 and <i>Table 92: NavIC Signal Mask</i> on page 440	Hex	4	H+16
7	Next satellite offset = H + 4 + (#entries x 16)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4 (#entries x 16)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 86: Observation Statuses**

Value	Name	Description
0	GOOD	Observation is good
1	BADHEALTH	Satellite is flagged as bad health in ephemeris or almanac
2	OLDEPHEMERIS	Ephemeris >3 hours old
6	ELEVATIONERROR	Satellite was below the elevation cutoff
7	MISCLOSURE	Observation was too far from predicted value
8	NODIFFCORR	No differential correction available
9	NOEPHEMERIS	No ephemeris available
10	INVALIDIODE	IODE used is invalid
11	LOCKEDOUT	Satellite has been locked out
12	LOWPOWER	Satellite has low signal power

Value	Name	Description
13	OBSL2	An L2 observation not directly used in the solution
15	UNKNOWN	Observation was not used because it was of an unknown type
16	NOIONOCORR	No ionosphere delay correction was available
17	NOTUSED	Observation was not used in the solution
18	OBSL1	An L1 observation not directly used in the solution
19	OBSE1	An E1 observation not directly used in the solution
20	OBSL5	An L5 observation not directly used in the solution
21	OBSE5	An E5 observation not directly used in the solution
22	OBSB2	A B2 observation not directly used in the solution
23	OBSB1	A B1 observation not directly used in the solution
24	OBSB3	A B3 observation not directly used in the solution
25	NOSIGNALMATCH	Signal type does not match
26	SUPPLEMENTARY	Observation contributes supplemental information to the solution
99	NA	No observation available
100	BAD_INTEGRITY	Observation was an outlier and was eliminated from the solution
101	LOSSOFLOCK	Lock was broken on this signal
102	NOAMBIGUITY	No RTK ambiguity type resolved

## 3.19 BESTUTM

### *Best available UTM data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the best available position computed by the receiver in UTM coordinates.

See also the **UTMZONE** command on page 388 and the **BESTPOS** log on page 429.

The latitude limits of the UTM System are 80°S to 84°N. If your position is outside this range, the BESTUTM log outputs a northing, easting and height of 0.0, along with a zone letter of '\*' and a zone number of 0, to indicate that the data in the log is unusable.

**Message ID:** 726

**Log Type:** Synch

**Recommended Input:**

```
log bestutma ontime 1
```

**ASCII Example:**

```
#BESTUTMA,COM1,0,73.0,FINESTEERING,1419,336209.000,02000040,eb16,2724;

## 3.20 BESTVEL

### *Best available velocity data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the best available velocity information computed by the receiver. In addition, it reports a velocity status indicator, which is needed to determine whether or not the corresponding data is valid. The velocities calculated by the receiver can have a latency associated with them. When present, the velocity time of validity is the time tag in the log minus the latency value.

The velocity is typically from the same source used in the BESTPOS solution. For example, if the BESTPOS is from the pseudorange filter, then the BESTVEL velocity type is the same as for PSRVEL. However, a specific velocity source can be chosen. See the **BESTVELTYPE** command on page 98.

In a BESTVEL log, the actual speed and direction of the receiver antenna over ground is provided. The receiver does not determine the direction a vessel, craft or vehicle is pointed (heading) but rather the direction of motion of the GNSS antenna relative to ground.

The RTK, PDP and PPP velocities are computed from the average change in position over the time interval between consecutive solutions. As such, they are an average velocity based on the time difference between successive position computations and not an instantaneous velocity at the BESTVEL time tag. The velocity latency to be subtracted from the time tag is normally half the time between filter updates. Under default operation, the positioning filters are updated at a rate of 2 Hz. *This average velocity translates into a velocity latency of 0.25 seconds.* To reduce the latency, increase the update rate of the positioning filter being used by requesting the BESTVEL or BESTPOS messages at a rate higher than 2 Hz. For example, a logging rate of 10 Hz would reduce the velocity latency to 0.05 seconds.

If the velocity in the BESTVEL log comes from the pseudorange filter, it has been computed from instantaneous Doppler measurements. You know that you have an instantaneous Doppler derived velocity solution when the velocity type is PSRDIFF, WAAS or DOPPLER\_VELOCITY. The instantaneous Doppler derived velocity has low latency and is not position change dependent. If you change your velocity quickly, you can see this in the DOPPLER\_VELOCITY solution. Under typically seen dynamics with minimal jerk, the velocity latency is zero. Under extreme, high-jerk dynamics, the latency cannot be well represented: it will still be reported as being zero, but may be as high as 0.15 seconds. Such dynamics are typically only seen in simulated trajectories.

**Message ID: 99**

**Log Type: Synch**

**Recommended Input:**

```
log bestvela ontime 1
```

**ASCII Example:**

```
#BESTVELA, COM1, 0, 61.0, FINESTEERING, 1337, 334167.000, 02000000, 827b, 1984;  
SOL_COMPUTED, PSRDIFF, 0.250, 4.000, 0.0206, 227.712486, 0.0493, 0.0*0e68bf05
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	BESTVEL header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	vel type	Velocity type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results (s)	Float	4	H+8
5	age	Differential age in seconds	Float	4	H+12
6	hor spd	Horizontal speed over ground, in meters per second	Double	8	H+16
7	trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees	Double	8	H+24
8	vert spd	Vertical speed, in meters per second, where positive values indicate increasing altitude (up) and negative values indicate decreasing altitude (down)	Double	8	H+32
9	Reserved		Float	4	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+44
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Velocity (speed and direction) calculations are computed from either Doppler or carrier phase measurements rather than from pseudorange measurements. Typical speed accuracies are around 0.03m/s (0.07 mph, 0.06 knots).

Direction accuracy is derived as a function of the vehicle speed. A simple approach would be to assume a worst case 0.03 m/s cross-track velocity that would yield a direction error function something like:

$$d(\text{speed}) = \tan^{-1}(0.03/\text{speed})$$

For example, if you are flying in an airplane at a speed of 120 knots or 62 m/s, the approximate directional error will be:

$$\tan^{-1}(0.03/62) = 0.03 \text{ degrees}$$

Consider another example applicable to hiking at an average walking speed of 3 knots or 1.5 m/s. Using the same error function yields a direction error of about 1.15 degrees.

You can see from both examples that a faster vehicle speed allows for a more accurate heading indication. As the vehicle slows down, the velocity information becomes less and less accurate. If the vehicle is stopped, a GNSS receiver still outputs some kind of movement at speeds between 0 and 0.5 m/s in random and changing directions. This represents the noise and error of the static position.

In a navigation capacity, the velocity information provided by your GNSS receiver is as, or more, accurate than that indicated by conventional instruments as long as the vehicle is moving at a reasonable rate of speed. It is important to set the GNSS measurement rate fast enough to keep up with all major changes of the vehicle's speed and direction. It is important to keep in mind that although the velocity vector is quite accurate in terms of heading and speed, the actual track of the vehicle might be skewed or offset from the true track by plus or minus 0 to 1.8 meters as per the standard positional errors.

## 3.21 BESTXYZ

### *Best available cartesian position and velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the receiver's best available position and velocity in ECEF coordinates. The position and velocity status fields indicate whether or not the corresponding data is valid. See *Figure 12: The WGS84 ECEF Coordinate System* on page 448, for a definition of the ECEF coordinates.

See also the **BESTPOS** log on page 429 and **BESTVEL** log on page 443.

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID:** 241

**Log Type:** Synch

**Recommended Input:**

```
log bestxyza ontime 1
```

**ASCII Example:**

**Figure 12: The WGS84 ECEF Coordinate System**

BIH - Defined CPT (1984.0)

**Table 93: Definitions**

- Origin = Earth's center of mass
- Z-Axis = Parallel to the direction of the Conventional Terrestrial Pole (CTP) for polar motion, as defined by the Bureau International de l'Heure (BIH) on the basis of the coordinates adopted for the BIH stations.
- X-Axis = Intersection of the WGS 84 Reference Meridian Plane and the plane of the CTP's Equator, the Reference Meridian being parallel to the Zero Meridian defined by the BIH on the basis of the coordinates adopted for the BIH stations.
- Y-Axis = Completes a right-handed, earth-centered, earth-fixed (ECEF) orthogonal coordinate system, measured in the plane of the CTP Equator, 90° East of the X-Axis.

These definitions are analogous to the BIH Defined Conventional Terrestrial System (CTS), or BTS, 1984.0.

## 3.22 BSLNXYZ

### *RTK XYZ baseline*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the receiver's RTK baseline in ECEF coordinates. The position status field indicates whether or not the corresponding data is valid. See *Figure 12: The WGS84 ECEF Coordinate System* on the previous page for a definition of the ECEF coordinates.

The BSLNXYZ log comes from time-matched base and rover observations such as in the **MATCHEDXYZ** log on page 612.

Asynchronous logs, such as BSLNXYZ, should only be logged ONCHANGED. Otherwise, the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

**Message ID:** 686

**Log Type:** Asynch

**Recommended Input:**

```
log bslnxyza onchanged
```

**ASCII Example:**

```
#BSLNXYZA,COM1,0,59.5,FINESTEERING,1419,340033.000,02000040,5b48,2724;SOL_
COMPUTED,NARROW_INT,0.0012,0.0002,-
0.0004,0.0080,0.0160,0.0153,"AAAA",12,12,12,12,0,01,0,33*1a8a1b65
```

Field	Field type	Data Description	Format	Binary Bytes	Binary Offset
1	BSLNXYZ header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	bsln type	Baseline type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4

20	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.23 CHANCONFIGLIST

### *Channel configuration list*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides the channel configuration list including the number of channels and signal types. If more than one channel configuration is available, then it can be switched using the **SELECTCHANCONFIG** command (see page 309).

**Message ID:** 1148

**Log Type:** Polled

**Recommended Input:**

```
log chanconfiglist once
```

**Abbreviated ASCII Example:**

```

50	BEIDOU B1B2B	BeiDou B1I, and B2b
51	BEIDOU B1B1CB2B2B	BeiDou B1I, B1C, B2I and B2b
52	BEIDOU B1B1CB2B2BB3	BeiDou B1I, B1C, B2I, B2b and B3
53	BEIDOU B1B1CB2B	BeiDou B1I, B1C and B2b
54	BEIDOU B1B2B2BB3	BeiDou B1I, B2I, B2b and B3
55	BEIDOU B1B2B2B	BeiDou B1I, B2I/B2a and B2b
56	BEIDOU B1B1CB2B2B	BeiDou B1I, B1C, B2I/B2a and B2b
57	BEIDOU B1B1CB2B2BB3	BeiDou B1I, B1C, B2I/B2a, B2b and B3
58	BEIDOU B1B2B2BB3	BeiDou B1I, B2I/B2a, B2b and B3

Configurations with **B2I** will track the B2I signal provided by BeiDou Phase II satellites. Configurations with **B2** will track either the B2I or B2a signal corresponding to BeiDou Phase II and Phase III satellites respectively, if the frequency is enabled by the model.

## 3.24 CLOCKMODEL

### *Current clock model status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The CLOCKMODEL log contains a filtered representation of the receiver's clock bias relative to GPS system time.

**Message ID:** 16

**Log Type:** Synch

**Recommended Input:**

```
log clockmodela ontime 1
```

**ASCII Example:**

```
#CLOCKMODEL, USB1, 0, 76.5, FINESTEERING, 2032, 240222.000, 02000020, 98f9, 32768;
VALID, 0, 240222.000, 240222.000, -9.477561087e-02, -4.830560778e-02, 0.000000000,
4.862723266e-02, 1.117247043e-03, 0.000000000, 1.117247043e-03, 4.002808929e-03,
0.000000000, 0.000000000, 0.000000000, 0.000000000, -0.030, -5.532940561e-02, FALSE
*71e347cc
```

The CLOCKMODEL log can be used to monitor the clock drift of an internal oscillator once the CLOCKADJUST mode has been disabled. Watch the CLOCKMODEL log to see the drift rate and adjust the oscillator until the drift stops.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	CLOCKMODEL header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	status	Clock model status. See <i>Table 95: Clock Model Status</i> on the next page	Enum	4	H
3	reject_count	Number of rejected instantaneous clock errors	Ulong	4	H+4
4	propagation_time	Time of last propagation	GPSec	4	H+8
5	update_time	Time of last update	GPSec	4	H+12

11	Reserved		Double	8	H+56
12	Reserved		Double	8	H+64
13	rate_variance	Receiver clock bias rate variance (m <sup>2</sup> /s <sup>2</sup> )	Double	8	H+72
14	Reserved		Double	8	H+80
15	Reserved		Double	8	H+88
16	Reserved		Double	8	H+96
17	Reserved		Double	8	H+104
18	instantaneous_bias	Last instantaneous receiver clock bias (m)	Double	8	H+112
19	instantaneous_rate	Last instantaneous receiver clock bias rate (m/s)	Double	8	H+120
20	Reserved		Bool	4	H+128
21	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+132
22	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 95: Clock Model Status

Clock Status (Binary)	Clock Status (ASCII)	Description
0	VALID	The clock model is valid
1	CONVERGING	The clock model is near validity
2	ITERATING	The clock model is iterating towards validity
3	INVALID	The clock model is not valid

## 3.25 CLOCKSTEERING

### *Clock steering status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The CLOCKSTEERING log is used to monitor the current state of the clock steering process. All oscillators have some inherent drift. By default the receiver attempts to steer the receiver clock to accurately match GPS reference time. If for some reason this is not desired, this behavior can be disabled using the **CLOCKADJUST** command (see page 103).

If the **CLOCKADJUST** command (see page 103) is ENABLED and the receiver is configured to use an external reference frequency (set in the **EXTERNALCLOCK** command (see page 148)), then the clock steering process takes over the VARF output pins and may conflict with a previously entered **EVENTOUTCONTROL** command (see page 146).

**Message ID:** 26

**Log Type:** Asynch

**Recommended Input:**

```
log clocksteeringa onchanged
```

**ASCII Example:**

```
#CLOCKSTEERINGA,COM1,0,56.5,FINESTEERING,1337,394857.051,02000000,0f61,1984;
INTERNAL,SECOND_ORDER,4400,1707.554687500,0.029999999,-2.000000000,-0.224,
0.060*0e218bbc
```

To configure the receiver to use an external reference oscillator, see the **EXTERNALCLOCK** command on page 148.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	CLOCKSTEERING header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	source	Clock source, see <i>Table 96: Clock Source</i> on the next page	Enum	4	H
3	steering state	Steering state, see <i>Table 97: Steering State</i> on the next page	Enum	4	H+4
4	period	Period of the pulse width modulated signal used to control the oscillator. This value is set using the <b>CLOCKCALIBRATE</b> command (see page 105).	Ulong	4	H+8

Field	Field type	Description	Format	Binary Bytes	Binary Offset
5	pulse width	Current pulse width of the pulse width modulated signal used to control the oscillator. The starting point for this value is set using the <b>CLOCKCALIBRATE</b> command (see page 105). The clock steering loop continuously adjusts this value in an attempt to drive the receiver clock offset and drift terms to zero.	Double	8	H+12
6	bandwidth	The current band width of the clock steering tracking loop in Hz. This value is set using the <b>CLOCKCALIBRATE</b> command (see page 105).	Double	8	H+20
7	slope	The current clock drift change in m/s/bit for a 1 LSB pulse width. This value is set using the <b>CLOCKCALIBRATE</b> command (see page 105).	Float	4	H+28
8	offset	The last valid receiver clock offset computed (m). It is the same as Field # 18 of the <b>CLOCKMODEL</b> log (see page 456).	Double	8	H+32
9	drift rate	The last valid receiver clock drift rate received (m/s). It is the same as Field # 19 of the <b>CLOCKMODEL</b> log (see page 456).	Double	8	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+48
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 96: Clock Source

Binary	ASCII	Description
0	INTERNAL	The receiver is currently steering its internal VCTCXO using an internal VARF signal
1	EXTERNAL	The receiver is currently steering an external oscillator using the external VARF signal

Table 97: Steering State

Binary	ASCII	Description
0	FIRST_ORDER	Upon start-up, the clock steering task adjusts the VARF pulse width to reduce the receiver clock drift rate to below 1 ms using a 1st order control loop. This is the normal start-up state of the clock steering loop.
1	SECOND_ORDER	Once the receiver has reduced the clock drift to below 1 m/s, it enters a second order control loop and attempts to reduce the receiver clock offset to zero. This is the normal runtime state of the clock steering process.

Binary	ASCII	Description
2	CALIBRATE_ HIGH	<p>This state corresponds to when the calibration process is measuring at the "High" pulse width setting.</p> <p>The CALIBRATE_HIGH state is only seen if you force the receiver to do a clock steering calibration using the <b>CLOCKCALIBRATE</b> command (see page 105). With the <b>CLOCKCALIBRATE</b> command (see page 105), you can force the receiver to calibrate the slope and center pulse width of the currently selected oscillator, to steer. The receiver measures the drift rate at several "High" and "Low" pulse width settings.</p>
3	CALIBRATE_ LOW	<p>This state corresponds to when the calibration process is measuring at the "Low" pulse width setting.</p> <p>The CALIBRATE_LOW state is only seen if you force the receiver to do a clock steering calibration using the <b>CLOCKCALIBRATE</b> command (see page 105). With the <b>CLOCKCALIBRATE</b> command (see page 105), you can force the receiver to calibrate the slope and center pulse width of the currently selected oscillator, to steer. The receiver measures the drift rate at several "High" and "Low" pulse width settings.</p>
4	CALIBRATE_ CENTER	<p>This state corresponds to the "Center" calibration process. Once the center has been found, the modulus pulse width, center pulse width, loop bandwidth and measured slope values are saved in NVM and are used from now on for the currently selected oscillator (INTERNAL or EXTERNAL).</p> <p>After the receiver has measured the "High" and "Low" pulse width setting, the calibration process enters a "Center calibration" process where it attempts to find the pulse width required to zero the clock drift rate.</p>

## 3.26 DATUMTRANSFORMATIONS

### *Available datum transformations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum transformations known to the receiver. This includes the default transformations included in the firmware, plus user-defined transformations entered using the **DATUMTRANSFORMATION** command (see page 121).

The entry "USER" to "WGS84" transformation in this log is the datum transformation set by the **USERDATUM** command (see page 378) or the **USEREXPDATUM** command (see page 380). The parameters in this entry will differ from those entered via the user datum commands due to differences in units and convention.

**Message ID:** 2298

**Log Type:** Asynch

**Recommended Input:**

```
log datumtransformations
```

**Abbreviated ASCII Example:**

```
<DATUMTRANSFORMATIONS COM1 0 40.5 UNKNOWN 0 0.395 02000048 f957 32768

## 3.27 DUALANTENNAHEADING

### *Synchronous heading information for dual antenna product*

**Platform:** OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2, SPAN CPT7

The heading is the angle from True North of the primary antenna to secondary antenna vector in a clockwise direction.

You must have an ALIGN capable, dual antenna receiver to use this log.

**Message ID:** 2042

**Log Type:** Synch

**Recommended Input:**

```
log dualantennaheadinga ontime 1
```

**ASCII Example:**

```
#DUALANTENNAHEADINGA, UNKNOWN, 0, 66.5, FINESTEERING, 1949, 575614.000, 02000000, d426,
32768; SOL_COMPUTED, NARROW_INT, -1.000000000, 255.538528442, 0.006041416, 0.0,
0.043859947, 0.052394450, "J56X", 24, 18, 18, 17, 04, 01, 00, 33*1f082ec5
```

Field	Field type	Description	Binary Format	Binary Bytes	Binary Offset
1	DUALANTENNA HEADING header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	sol stat	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	length	Baseline length in meters For ALIGN Heading models, this field is -1. For ALIGN Relative Positioning models with a fixed position, this field is -1. For ALIGN Relative Positioning models, this field is the baseline length in meters, unless the position is fixed.	Float	4	H+8
5	heading	Heading in degrees (0° to 359.999°)	Float	4	H+12
6	pitch	Pitch (±90 degrees)	Float	4	H+16
7	Reserved		Float	4	H+20
8	hdg std dev	Heading standard deviation in degrees	Float	4	H+24

Field	Field type	Description	Binary Format	Binary Bytes	Binary Offset
9	ptch std dev	Pitch standard deviation in degrees	Float	4	H+28
10	stn ID	Station ID string	Char[4]	4	H+32
11	#SVs	Number of satellites tracked	Uchar	1	H+36
12	#solnSVs	Number of satellites used in solution	Uchar	1	H+37
13	#obs	Number of satellites above the elevation mask angle	Uchar	1	H+38
14	#multi	Number of satellites with multi-frequency signals used in solution	Uchar	1	H+39
15	sol source	Solution source (see <i>Table 117: Solution Source</i> on page 555)	Hex	1	H+40
16	ext sol stat	Extended solution status (see <i>Table 84: Extended Solution Status</i> on page 436)	Hex	1	H+41
17	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+42
18	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+43
19	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+44
20	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.28 ETHSTATUS

### *Current Ethernet status*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This log provides the current status of the Ethernet ports.

**Message ID:** 1288

**Log Type:** Polled

**Recommended Input:**

```
log ethstatusa once
```

**ASCII Example:**

```
#ETHSTATUSA,COM1,0,89.5,FINESTEERING,1609,500138.174,02000000,e89d,6259;1,ETHA,
"00-21-66-00-05-A2",100_FULL*98d86b04
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	ETHSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#of interfaces	Number of records to follow	Ulong	4	H
3	interface	Name of the Ethernet interface (e.g., ETHA)	Enum	4	H+4
4	MAC address	An identifier assigned to the network adapters or network interface card	String [18]	variable 1	H+8
5	interface configuration	Current connectivity, speed and duplex settings of the Ethernet interface	Enum	4	H+26
6...	Next interface = H+4+(# of interfaces * 26)				
7	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+(# of interfaces * 26)
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Refer to the **ETHCONFIG** command (see page 142) for enum values.

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 3.29 FILELIST

### *Display the storage media contents*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

PwrPak7M variants do not support this log.

Use this log to display the root directory of the active media. A log is produced for each file and directory in the root directory.

The active media is set with the **FILEMEDIACONFIG** command on page 155.

**Message ID: 2100**

**Log Type: Asynch**

**Recommended Input:**

```
log filelista
```

**ASCII Example:**

```
#FILELISTA, COM1, 0, 95.0, UNKNOWN, 0, 77428.011, 024c4009, e8c9, 32768; USBSTICK, 0, 20161117, 104430, "blah.txt"*a212a600
```

```
#FILELISTA, COM1, 1, 94.5, UNKNOWN, 0, 77428.011, 024c4009, e8c9, 32768; USBSTICK, 0, 19700101, 0, "BMHR15470145U_1930_501232.LOG"*d12f9c46
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILELIST header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MassStorageDevice	Mass Storage Device See <i>Table 99: Mass Storage Device</i> on page 469	Enum	4	H
3	FileType	The type of entry for this log. See <i>Table 98: File Type</i> on the next page	Enum	4	H+4
4	FileSize	File Size (in Bytes)	Ulong	4	H+8
5	ChangeDate	Date of the last change	Ulong	4	H+12
6	ChangeTime	Time of last change	Ulong	4	H+16
7	FileName	Name of the file or directory File Name STRING Variable H + 20	String	Variable	H+20
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	Variable
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 98: File Type

Binary	ASCII	Description
0	NONE	Indicates there are no entries in the selected media
1	FILE	File
2	DIR	Directory

When there no files or directories on the specified media, a single **FILELIST** log is output with **FileType** set to *NONE* and file information set to *0* and empty strings.

## 3.30 FILESTATUS

*Displays the state of the data log file*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

PwrPak7M variants do not support this log.

Use this log to display the current state of the data log file. Typically the **FILESTATUS** log is used to determine if the log file is open for writing or closed. However, it also shows any error that has occurred.

**Message ID: 2127**

**Log Type: Asynch**

**Recommended Input:**

```
log filestatusa
```

**ASCII Example**

```
#FILESTATUSA,USB3,0,75.0,FINESTEERING,1983,171080.615,02104020,4dbd,14434;INTERNAL_FLASH,CLOSED,"",0,14039057,15754462,""*7de99c77
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILESTATUS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MassStorageDevice	The type of recording device See <i>Table 99: Mass Storage Device</i> on the next page.	Enum	4	H
3	FileStatus	File status See <i>Table 100: File Status</i> on the next page.	Enum	4	H+4
4	FileName	Filename of the log file	Fixed Uchar Array	MAX_FILENAME_LENGTH (MFL)	H+8
5	FileSize	File Size (bytes)	Ulong	4	H+MFL+8
6	MediaRemainingCapacity	Remaining capacity on the storage media (kb)	Ulong	4	H+MFL+12
7	MediaTotalCapacity	Total capacity of the storage media (kb)	Ulong	4	H+MFL+16
8	ErrorMsg	Error Message	String	Variable	H+MFL+20

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
9	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	Variable
10	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 99: Mass Storage Device**

Binary	ASCII	Description
1	USBSTICK	USB mass storage device
2	RAMDRIVE	-
3	NO_STORAGE	No mass storage
4	INTERNAL_FLASH	Internal eMMC flash

**Table 100: File Status**

Binary	ASCII	Description
1	OPEN	Log file is open
2	CLOSED	Log file is closed
3	BUSY	Media device is busy
4	ERROR	An error has occurred
5	COPY	Media is copying
6	PENDING	Operation during initialization state

## 3.31 FILESYSTEMCAPACITY

*Displays storage capacity available*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

PwrPak7M variants do not support this log.

Use this log to check the amount of storage capacity available in both the internal and external storage.

**Message ID: 2137**

**Log Type: Polled**

**Recommended Input:**

```
log filesystemcapacity
```

**Abbreviated ASCII Example:**

```
<FILESYSTEMCAPACITY COM1 0 92.0 UNKNOWN 0 2736.008 0244c009 fded 32768
< 2
< USBSTICK 31546671104 688128
< INTERNAL_FLASH 14735147008 12288
```

**ASCII Example:**

```
#FILESYSTEMCAPACITYA,COM1,0,92.0,UNKNOWN,0,2767.008,0244c009,fded,32768;2,USBSTICK,31546671104,688128,INTERNAL_FLASH,14735147008,12288*8a8d384b
```

The INTERNAL\_FLASH is only present on the PwrPak7.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILESYSTEMCAPACITY header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#Dev	Number of device with data to follow	Ulong	4	H
3	MassStorageDevice	File system type (recording device) See <i>Table 99: Mass Storage Device</i> on the previous page	Enum	4	H+4
4	TotalStorage	Total storage on device in bytes	Ulong	8	H+8
5	UsedStorage	Amount of storage used on the device in bytes	Ulong	8	H+16
6	Next device offset = H+4+(#Dev x 20)				

---

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+ (#Dev x 20)
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.32 FILESYSTEMSTATUS

### *Display state of recording media*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

PwrPak7M variants do not support this log.

This log displays the current state of the recording media. It can be used to determine the state of the file system, such as any mounting errors.

When logging the FILESYSTEMSTATUS log, use the **ONNEW** or **ONCHANGED** log trigger.

**Message ID: 2104**

**Log Type: Asynch**

**Recommended Input:**

```
log filesystemstatusa onchanged
```

**Abbreviated ASCII Example:**

```
<FILESYSTEMSTATUS COM1 1 91.5 UNKNOWN 0 5.387 02000020 143c 32768
<   USBSTICK MOUNTED 3862430 ""

<FILESYSTEMSTATUS COM1 0 91.5 COARSESTEERING 1953 153609.680 02000020 143c
32768
<   INTERNAL_FLASH MOUNTED 14756709 ""
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILESYSTEMSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	MassStorageDevice	Recording Device See <i>Table 99: Mass Storage Device</i> on page 469	Enum	4	H
3	MassStorageStatus	Media Status See <i>Table 101: Mass Storage Status</i> on the next page	Enum	4	H+4
4	TotalCapacity	Media total capacity (in kB)	Ulong	4	H+8
5	ErrorMsg	Error Message	String	Variable	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	Variable
7	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

**Table 101: Mass Storage Status**

Binary	ASCII	Description
0	UNMOUNTED	Mass storage unmounted
1	MOUNTED	Mass storage mounted
2	BUSY	Mass storage busy. i.e. formatting
3	ERROR	Mounting error
4	MOUNTING	Mass storage is being mounted
5	UNMOUNTING	Mass storage is being unmounted

### 3.33 FILETRANSFERSTATUS

*Display the current state of a file transfer*

Platform: PwrPak7

PwrPak7M variants do not support this log.

This log contains the current state of a file transfer from the internal memory to a USB stick. This logs also indicates any file transfer errors that may have occurred.

**Message ID: 2101**

**Log Type: Asynch**

**Recommended Input:**

```
log filetransferstatusa onchanged
```

**ASCII Example:**

```
<FILETRANSFERSTATUS COM1 0 38.0 FINESTEERING 1953 248960.848 02440020 ce81
32768 TRANSFERRING 0 4096035 "NPP714520001W_2017-06-10_01-16-20.LOG" ""

<FILETRANSFERSTATUS COM1 0 88.5 FINESTEERING 1953 248961.853 02000020 ce81
32768 TRANSFERRING 1138 4096035 "NPP714520001W_2017-06-10_01-16-20.LOG" ""

<FILETRANSFERSTATUS COM1 0 17.5 FINESTEERING 1953 248962.853 02000020 ce81
32768 TRANSFERRING 2277 4096035 "NPP714520001W_2017-06-10_01-16-20.LOG" ""
```

...

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	FILETRANSFERSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	File Transfer Status	The status of the file transfer. See <i>Table 102: File Transfer Status</i> on the next page.	Enum	4	H
3	Total Transferred	Total amount of data transferred.(kbytes)	Ulong	4	H+4
4	Total Transfer Size	Total size of the data to transfer.(kbytes)	Ulong	4	H+8
5	Filename	Name of the file that is currently transferring.	String	Variable	H+12
6	Error Msg	Error message (if an error occurred)	String	Variable	Variable
7	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	Variable
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 102: File Transfer Status**

<b>Binary Value</b>	<b>ASCII Value</b>	<b>Description</b>
1	NONE	There is no file transfer in progress
2	TRANSFERRING	There is an active file transfer
3	FINISHED	The transfer has been successfully completed
4	ERROR	An error occurred during the transfer
5	CANCELLED	A user cancelled the active file transfer

## 3.34 GALALMANAC

### *Decoded Galileo Almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the decoded Galileo almanac parameters from Galileo navigation messages. Multiple messages are transmitted, one for each satellite ID with data. The Galileo almanac can come from any of the E1, E5a or E5b signals.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

**Message ID:** 1120

**Log Type:** Asynch

**Recommended Input:**

```
log galalmanaca onchanged
```

**ASCII Example:**

```
#GALALMANACA, COM1, 3, 83.5, SATTIME, 1769, 333371.000, 02000020, 131f, 45362;

```

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALALMANAC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
2	SatId	Satellite ID	Ulong	4	H
3	FNAVReceived	Indicates F/NAV almanac data received	Bool	4	H+4
4	INAVReceived	Indicates I/NAV almanac data received	Bool	4	H+8
5	E1BHealth	E1B health status bits (only valid if INAVReceived is TRUE)	Uchar	1	H+12
6	E5aHealth	E5a health status bits (only valid if FNAVReceived is TRUE)	Uchar	1	H+13
7	E5bHealth	E5b health status bits (only valid if INAVReceived is TRUE)	Uchar	1	H+14
8	Reserved		Uchar	1	H+15
9	IODa	Almanac issue of data	Ulong	4	H+16
10	Weeks	Almanac reference week since the Galileo system time start epoch (August 22nd 1999)	Ulong	4	H+20
11	Seconds	Almanac reference time of week (s for ASCII, ms for binary)	GPsec	4	H+24
12	Ecc	Eccentricity (dimensionless)	Double	8	H+28
13	OmegaDot	Rate of right ascension (radians/s)	Double	8	H+36
14	Omega0	Right ascension (radians)	Double	8	H+44
15	Omega	Argument of perigee (radians)	Double	8	H+52
16	M0	Mean anomaly at ref time (radians)	Double	8	H+60
17	Af0	Satellite clock correction bias (s)	Double	8	H+68
18	Af1	Satellite clock correction linear (s/s)	Double	8	H+76
19	DeltaRootA	Difference with respect to the square root of the nominal semi-major axis ( $\sqrt{m}$ ) <sup>1</sup>	Double	8	H+84
20	DeltaI	Difference with respect to the nominal inclination at reference time (radians) <sup>2</sup>	Double	8	H+92
21	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+100
22	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>Nominal value is 29,600,000 m.

<sup>2</sup>Nominal value is 56 degrees.

## 3.35 GALCLOCK

### *Galileo clock information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the Galileo time information.

This log is populated from both the I/NAV and F/NAV messages from any of the E1, E5a or E5b signals. Depending on the data source, it is possible that the time in the header of the log is earlier than the time in a previous log. This is expected behavior.

**Message ID:** 1121

**Log Type:** Asynch

**Recommended Input:**

```
log galclocka onchanged
```

**ASCII Example:**

```
#GALCLOCKA, COM1, 0, 84.5, SATTIME, 1769, 336845.000, 02000020, c6cf, 45362;
8.381903172e-09, -3.5527137e-15, 16, 259200, 233, 28, 7, 16, -3.5216e-09,
-1.776e-14, 345600, 41*186e9085
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALCLOCK header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	A0	Constant term of polynomial (s)	Double	8	H
3	A1	1st order term of polynomial (s/s)	Double	8	H+8
4	DeltaTls	Leap second count before leap second adjustment	Long	4	H+16
5	Tot	UTC data reference time of week (s)	Ulong	4	H+20
6	WNt	UTC data reference week number	Ulong	4	H+24
7	WNlsf	Week number of leap second adjustment	Ulong	4	H+28
8	DN	Day number at the end of which a leap second adjustment becomes effective	Ulong	4	H+32
9	DeltaTlsf	Leap second count after leap second adjustment	Long	4	H+36
10	A0g	Constant term of the polynomial describing the difference between Galileo and GPS time (s)	Double	8	H+40
11	A1g	Rate of change of offset the offset between Galileo and GPS time (s/s)	Double	8	H+48

---

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
12	T0g	Reference time for GGTO data (s)	Ulong	4	H+56
13	WN0g	Week number of GGTO reference	Ulong	4	H+60
14	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+64
15	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.36 GALCNAVRAWPAGE

### *Galileo raw CNAV page*

**Platform:** OEM719, OEM729, OEM7500, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART7-I, SMART7-S, SMART7-SI, SMART7-W

This log provides Galileo raw C/NAV page data from Galileo E6 signals.

The **GALCNAVRAWPAGE** log is not output by default. To receive this log, data decoding for E6B/E6C must be enabled using the **DATADECODESIGNAL** command (see page 115) the specific signal.

**Message ID:** 2239

**Log Type:** Asynch

**Recommended Input:**

```
log galcnavrwapage onnew
```

**Abbreviated ASCII Example:**

```
<GALCNAVRAWPAGE USB1 0 49.5 SATTIME 1997 145162.000 02040020 ab53 32768
< 319 30 2761 2b26bcef0c04f6711bf86137086a12c14f87c07b4c6aa4de04bceb8612c34
c691bfabceceb86bcd4f851bfb0c074c68613604bff48448d33487
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALCNAVRAWPAGE header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	signal channel	Signal channel providing the bits	Ulong	4	H
3	PRN	Satellite PRN number	Ulong	4	H+4
4	Page ID	The page ID	Ulong	4	H+8
5	data	Raw CNAV page data	HEX [58]	58	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	h+70
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.37 GALFNAVEPHEMERIS

#### *Decoded Galileo FNAV Ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The GALFNAVEPHEMERIS log contains the Galileo F/NAV ephemeris information. Multiple messages are transmitted, one for each satellite ID. The F/NAV messages are only transmitted on E5a.

**Message ID:** 1310

**Log Type:** Asynch

**Recommended Input:**

```
log galfnavephemerisa onchanged
```

**ASCII Example:**

```
#GALFNAVEPHEMERISA,COM2,0,82.5,SATTIME,1874,148850.000,02400000,02cd,
32768;22,0,0,0,0,118,122,0,147600,147600,-6.101167919e-01,3.1687e-09,

```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALFNAVEPHEMERIS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	SatId	Satellite identifier	Ulong	4	H
3	E5aHealth	E5a health status bits	Uchar	1	H+4
4	E5aDVS	E5a data validity status	Uchar	1	H+5
5	Reserved		Uchar	1	H+6
6	Reserved		Uchar	1	H+7
7	IODnav	Issue of data ephemeris	Ushort	2	H+8
8	SISA Index	Signal in space accuracy (unitless)	Uchar	1	H+10
9	Reserved		Uchar	1	H+11
10	T0e	Ephemeris reference time (s)	Ulong	4	H+12
11	T0c	Clock correction data reference time of week from the F/NAV message (s)	Ulong	4	H+16
12	M0	Mean anomaly at ref time (radians)	Double	8	H+20
13	DeltaN	Mean motion difference (radians/s)	Double	8	H+28

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
14	Ecc	Eccentricity (unitless)	Double	8	H+36
15	RootA	Square root of semi-major axis	Double	8	H+44
16	I0	Inclination angle at ref time (radians)	Double	8	H+52
17	IDot	Rate of inclination angle (radians/s)	Double	8	H+60
18	Omega0	Longitude of ascending node of orbital plane at weekly epoch (radians)	Double	8	H+68
19	Omega	Argument of perigee (radians)	Double	8	H+76
20	OmegaDot	Rate of right ascension (radians/s)	Double	8	H+84
21	Cuc	Amplitude of the cosine harmonic correction term to the argument of latitude (radians)	Double	8	H+92
22	Cus	Amplitude of the sine harmonic correction term to the argument of latitude (radians)	Double	8	H+100
23	Crc	Amplitude of the cosine harmonic correction term to the orbit radius (m)	Double	8	H+108
24	Crs	Amplitude of the sine harmonic correction term to the orbit radius (m)	Double	8	H+116
25	Cic	Amplitude of the cosine harmonic correction term to the angle of inclination (radians)	Double	8	H+124
26	Cis	Amplitude of the sine harmonic correction term to the angle of inclination (radians)	Double	8	H+132
27	Af0	SV clock bias correction coefficient from the F/NAV message (s)	Double	8	H+140
28	Af1	SV clock drift correction coefficient from the F/NAV message (s/s)	Double	8	H+148
29	Af2	SV clock drift rate correction coefficient from the F/NAV message (s/s <sup>2</sup> )	Double	8	H+156
30	E1E5aBGD	E1, E5a broadcast group delay	Double	8	H+164
31	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+172
32	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.38 GALFNAVRAWALMANAC

### *Galileo FNAV raw almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The GALFNAVRAWALMANAC log contains the Galileo F/NAV raw almanac information. This log contains the raw bits from page types 5 and 6. The F/NAV messages are only transmitted on E5a.

**Message ID:** 1123

**Log Type:** Asynch

**Recommended Input:**

```
log galfnavalmanaca onchanged
```

**ASCII Example:**

```
#GALFNAVRAWALMANACA,COM1,17,79.0,SATTIME,2011,157650.000,02000020,5a64,32768;

### 3.39 GALFNAVRAWEPHEMERIS

#### *Galileo FNAV raw ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The GALFNAVEPHEMERIS log contains the Galileo F/NAV raw ephemeris information. This log contains raw ephemeris data from page type 1 to page type 4. The F/NAV messages are only transmitted on E5a.

**Message ID:** 1124

**Log Type:** Asynch

**Recommended Input:**

```
log GALFNAVRAWEPHEMERISA onchanged
```

**ASCII Example:**

```
#GALFNAVRAWEPHEMERISA,COM1,15,76.5,SATTIME,2010,516700.000,02000020,4c19,32768;

## 3.40 GALFNAVRAWPAGE

### *Raw Galileo FNAV page data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw Galileo F/NAV page data. The F/NAV messages are only transmitted on E5a.

**Log Type:** Asynch

**Recommended Input:**

```
log galfnavrpagea onchanged
```

**ASCII Example:**

```
#GALFNAVRAWPAGEA,USB3,0,85.0,SATTIME,1680,434410.000,02000008,d4fb,43274;56,11,0b818df50ad5ffc151001baffdaa04d5dae655e17affc8a41a83aa*5955b14d
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALFNAVRAWPAGE header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	signal channel	Signal channel providing the data	Ulong	4	H
3	SVID	SVID of transmitting satellite	Ulong	4	H+4
4	raw frame data	Raw F/NAV page (214 bits). Does not include CRC or Tail bits.	Hex [27]	27	H+8
5	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+35
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.41 GALINAVEPHEMERIS

### *Decoded Galileo INAV Ephemeris*

**Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2**

The GALINAVEPHEMERIS log contains the Galileo I/NAV ephemeris information. Multiple messages are transmitted, one for each SVID with date. The I/NAV messages are only transmitted on E1 and E5b.

**Message ID: 1309**

**Log Type: Asynch**

**Recommended Input:**

```
log galinavephemerisa onchanged
```

**ASCII Example:**

```
#GALINAVEPHEMERISA, COM1, 10, 82.0, SATTIME, 1930, 494134.000, 02000020, dbe9,

## 3.42 GALINAVRAWALMANAC

### *Galileo INAV raw almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The GALINAVRAWALMANAC log contains the Galileo I/NAV raw almanac information. This log contains the I/NAV raw data from word types of 7 to 10. The I/NAV messages are only transmitted on E1 and E5b.

**Message ID:** 1125

**Log Type:** Asynch

**Recommended Input:**

```
log galinavalmanaca onchanged
```

**ASCII Example:**

```
#GALINAVRAWALMANACA,COM1,17,75.0,SATTIME,2011,155530.000,02000020,53f2,32768;2,3,154800,0401c0420ca8278078ff2ad09ff30fff00000000*a734b80e
```

```

### 3.43 GALINAVRAWEPHEMERIS

#### *Galileo FNAV raw ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The GALINAVEPHEMERIS log contains the Galileo I/NAV raw ephemeris information. This log contains the ephemeris raw data from word types of 1 to 6. The I/NAV messages are only transmitted on E1 and E5b.

**Message ID:** 1126

**Log Type:** Asynch

**Recommended Input:**

```
log GALINAVRAWEPHEMERISA onchanged
```

**ASCII Example:**

```

## 3.44 GALINAVRAWWORD

### *Raw Galileo INAV word data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw Galileo I/NAV word data. The I/NAV messages are only transmitted on E1 and E5b.

**Message ID:** 1414

**Log Type:** Asynch

**Recommended Input:**

```
log galinavrawworda onchanged
```

**ASCII Example:**

```
#GALINAVRAWWORDA,USB3,0,84.5,SATTIME,1680,434401.000,02000008,884b,43274;55,11,GALE1,0b81e655e17a26eb5237d7d20088ffc9*dcb4bedb
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALINAVRAWWORD header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	signal channel	Signal channel providing data	Ulong	4	H
3	SVID	Space Vehicle ID (SVID) of transmitting satellite	Ulong	4	H+4
4	signal type	Signal Type as defined in <i>Table 103: Signal Type</i> below	Enum	4	H+8
5	raw frame data	Raw I/NAV word (128 bits)	Hex [16]	16	H+12
6	xxxx	32-bit CRC (ASCII and binary only)	Hex	4	H+28
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 103: Signal Type**

Value (Binary)	Signal (ASCII)	Description
33	GPSL1CA	GPS L1 C/A-code
47	GPSL1CP	GPS L1C P-code
68	GPSL2Y	GPS L2 P(Y)-code
69	GPSL2C	GPS L2 C/A-code
70	GPSL2P	GPS L2 P-code

Value (Binary)	Signal (ASCII)	Description
103	GPSL5	GPS L5
2177	GLOL1CA	GLONASS L1 C/A-code
2211	GLOL2CA	GLONASS L2 C/A-code
2212	GLOL2P	GLONASS L2 P-code
2662	GLOL3	GLONASS L3
4129	SBASL1	SBAS L1
4194	SBASL5	SBAS L5
10433	GALE1	Galileo E1
10466	GALE5A	Galileo E5A
10499	GALE5B	Galileo E5B
10532	GALALTB0C	Galileo ALT-BOC
10565	GALE6C	Galileo E6C
10572	GALE6B	Galileo E6B
12673	BDSB1D1	BeiDou B1 with D1 navigation data
12674	BDSB1D2	BeiDou B1 with D2 navigation data
12803	BDSB2D1	BeiDou B2I with D1 navigation data
12804	BDSB2D2	BeiDou B2I with D2 navigation data
12877	BDSB3D1	BeiDou B3 with D1 navigation data
12880	BDSB3D2	BeiDou B3 with D2 navigation data
12979	BDSB1C	BeiDou B1C
13012	BDSB2A	BeiDou B2a
13077	BDSB2BI	BeiDou B2b (I)
14753	QZSSL1CA	QZSS L1 C/A-code

## 3.45 GALIONO

### *Decoded Galileo ionospheric corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the decoded Galileo ionospheric corrections.

**Message ID:** 1127

**Log Type:** Asynch

**Recommended Input:**

```
log galionoa onchanged
```

**ASCII Example:**

```
#GALIONOA,COM1,0,81.5,SATTIME,1930,512134.000,02000020,d22e,32768;  
6.03e+01,-2.344e-02,-3.9368e-03,0,0,0,0,0*f50fae69
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	GALIONO header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Ai0	Effective ionization level 1st order parameter (sfu)	Double	8	H
3	Ai1	Effective ionization level 2st order parameter (sfu/degree)	Double	8	H+8
4	Ai2	Effective ionization level 3st order parameter (sfu/degree <sup>2</sup> )	Double	8	H+16
5	SF1	Ionospheric disturbance flag for region 1	Uchar	1	H+24
6	SF2	Ionospheric disturbance flag for region 2	Uchar	1	H+25
7	SF3	Ionospheric disturbance flag for region 3	Uchar	1	H+26
8	SF4	Ionospheric disturbance for flag region 4	Uchar	1	H+27
9	SF5	Ionospheric disturbance for flag region 5	Uchar	1	H+28
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+29
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.46 GEODETICDATUMS

### *Available datums*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log shows a list of available datums. User-defined datums can be added using the **GEODETICDATUM** command (see page 179).

The "USER" entry in the this log is the datum set by the **USERDATUM** command (see page 378) or the **USEREXPDATUM** command (see page 380).

**Message ID:** 2296

**Log Type:** Asynch

**Recommended Input:**

```
log geodeticdatums
```

**Abbreviated ASCII Example:**

```
<GEODETICDATUMS COM1 0 23.0 UNKNOWN 0 0.381 02000048 e7f2 32768

variable	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.47 GLMLA

### ***NMEA GLONASS L1 C/A Almanac data***

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log outputs L1 C/A almanac data for GLONASS satellites. Multiple sentences are transmitted, one for each satellite.

The following relationships enable translation between the NMEA GLONASS satellite IDs, the NovAtel GLONASS PRN IDs, and the GLONASS slot numbers:

NMEA GLONASS satellite ID	= GLONASS slot number + 64
NovAtel GLONASS PRN ID	= GLONASS slot number + 37
	= NMEA GLONASS satellite ID - 27

**Message ID:** 859

**Log Type:** Asynch

**Recommended Input:**

```
log glmlaa onchanged
```

Refer to the GLONASS section of *An Introduction to GNSS* available on our website at [nova-tel.com/an-introduction-to-gnss](http://nova-tel.com/an-introduction-to-gnss).

Field	Structure	Description	Symbol	Example
1	\$GLMLA	Log header. See <i>Messages</i> on page 30 for more information.		\$GLMLA
2	#alm	Number of NMEA almanac messages in the set	x.x	16
3	alm#	Current message number	x.x	13
4	slot	Slot number for satellite (65-96) The NMEA GLONASS PRN numbers are 64 plus the GLONASS slot number. Current slot numbers are 1 to 24 which give the range 65 to 88. PRN numbers 89 to 96 are available if slot numbers above 24 are allocated to on-orbit spares.	xx	85
5	N	Calendar day count within the four year period from the last leap year	x.x	1176
6	hlth & freq	Health and frequency for satellite Health and carrier frequency numbers are represented in this 2-character Hex field as: hh = [8][7][6][5][4][3][2][1] (LSB) 	hh	88
7	ecc	Eccentricity <sup>1</sup>	hhhh	01a6
8	$\Delta Tdot$	Rate of change of orbital period (s/orbital period <sup>2</sup> ) <sup>1</sup>	hh	0d
9	w	Argument of perigee (PZ-90.02) (radians) <sup>1</sup>	hhhh	9dc9

<sup>1</sup>The LSB of the Hex data field corresponds to the LSB of the word indicated in the Table 4.3 of the GLONASS Interface Control Document, 1995. If the number of available bits in the Hex field is greater than the word, the MSB (upper bits) are unused and filled with zeroes.

Field	Structure	Description	Symbol	Example
10	t <sub>16MSB</sub>	Clock offset, in seconds (s) <sup>1</sup>	hhhh	8000
11	ΔT	Correction to the mean value of the Draconian period (s/orbital period) <sup>1</sup>	hhhhhh	34bff8
12	tπ	GLONASS Time of ascending node equator crossing (s) <sup>1</sup>	hhhhhhh	031887
13	l	Longitude of ascending node equator crossing (PZ-90.02) (radians) <sup>1</sup>	hhhhhhh	02da1e
14	Δi	Correction to nominal inclination (radians) <sup>1</sup>	hhhhhhh	002838
15	t <sub>12LSB</sub>	Clock offset (s) <sup>1</sup>	hhh	099
16	t	Coarse value of the time scale shift <sup>1</sup>	hhh	242
17	xxxx	32-bit CRC (ASCII and Binary only)	Hex	*6D
18	[CR][LF]	Sentence terminator (ASCII only)	-	[CR][LF]

## 3.48 GLOALMANAC

### *Decoded GLONASS L1 C/A Almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The GLONASS L1 C/A almanac reference time and week are in GPS reference time coordinates. GLONASS ephemeris information is available through the **GLOEPHEMERIS** log (see page 504).

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

**Message ID:** 718

**Log Type:** Asynch

**Recommended Input:**

```
log gloalmanaca onchanged
```

**ASCII Example:**

19	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.49 GLOCLOCK

### *GLONASS L1 C/A clock information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the time difference information between GPS and GLONASS time as well as status flags. The status flags are used to indicate the type of time processing used in the least squares adjustment. GPS and GLONASS time are both based on the Universal Time Coordinated (UTC) time scale with some adjustments. GPS reference time is continuous and does not include any of the leap second adjustments to UTC applied since 1980. The result is that GPS reference time currently leads UTC time by 15 seconds.

GLONASS time applies leap seconds but is also three hours ahead to represent Moscow time. The nominal offset between GPS and GLONASS time is therefore due to the three hour offset minus the leap second offset. As well as the nominal offset, there is a residual offset on the order of nanoseconds which must be estimated in the least squares adjustment. The GLONASS-M satellites broadcasts this difference in the navigation message.

This log also contains information from the GLONASS navigation data relating GLONASS time to UTC.

**Message ID:** 719

**Log Type:** Asynch

**Recommended Input:**

```
log gloclocka onchanged
```

**ASCII Example:**

```
#GLOCLOCKA,COM1,0,54.5,SATTIME,1364,411884.000,02000000,1d44,2310;
0,0.000000000,0.000000000,0,0,-0.000000275,792,-0.000001207,
0.000000000,0.000000000,0*437e9afaf
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	GLOCLOCK header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Reserved		Ulong	4	H
3			Double	8	H+4
4			Double	8	H+12
5	sat type	Satellite type where 0 = GLO_SAT 1 = GLO_SAT_M (M type) 2 = GLO_SAT_K (K type)	Uchar	1	H+20
6	N <sup>4</sup>	Four-year interval number starting from 1996	Uchar	1 <sup>1</sup>	H+21

<sup>1</sup>In the binary log case, additional bytes of padding are added to maintain 4-byte alignment.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
7	T <sub>GPS</sub>	Correction to GPS time relative to GLONASS time	Double	8	H+24
8	N <sup>A</sup>	GLONASS calendar day number within a four year period beginning since the leap year, in days	Ushort	2 <sup>1</sup>	H+32
9	T <sub>C</sub>	GLONASS time scale correction to UTC(SU) given at beginning of day N4 (s)	Double	8	H+36
10	b1	Beta parameter 1st order term	Double	8	H+44
11	b2	Beta parameter 2nd order term	Double	8	H+52
12	Kp	Kp provides notification of the next expected leap second. For more information, see <i>Table 104: Kp UTC Leap Second Descriptions</i> below	Uchar	1	H+60
13	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+61
14	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 104: Kp UTC Leap Second Descriptions

Kp	Information on UTC Leap Second <sup>1</sup>
00	No UTC update for this quarter
01	UTC update of plus 1 second at the end of current quarter
11	UTC update of minus 1 second at end of current quarter

---

<sup>1</sup>Based on GLONASS ICD version 5.1, 2008.

## 3.50 GLOEPHEMERIS

### *Decoded GLONASS L1 C/A ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains GLONASS L1 C/A ephemeris information. GLONASS ephemerides are referenced to the PZ90.02 geodetic datum. No adjustment between the GPS and GLONASS reference frames are made for positioning. Multiple messages are transmitted, one for each SVID with data.

**Message ID:** 723

**Log Type:** Asynch

**Recommended Input:**

N0	0	P1 Flag - Time interval between adjacent iISSUE (fb) values	See <i>Table 106: P1 Flag Range Values</i> below	00000001
	1			00000002
	2	P2 Flag - Oddness or Evenness of iISSUE (fb) value	0 = even 1 = odd	00000004
	3	P3 Flag - Number of satellites with almanac information within current subframe	0 = four 1 = five	00000008
N-1 through N-7	4 ... 31	Reserved		

**Table 106: P1 Flag Range Values**

State	Description
00	0 minutes
01	30 minutes
10	45 minutes
11	60 minutes

## 3.51 GLORAWALM

### Raw GLONASS L1 C/A Almanac data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw L1 C/A almanac subframes as received from the GLONASS satellite.

**Message ID:** 720

**Log Type:** Asynch

**Recommended Input:**

```
log glorawalma onchanged
```

**Example:**

```
#GLORAWALMA,COM1,0,44.5,SATTIME,1364,419924.000,02000000,77bb,2310;

Field	Field type	Description	Format	Binary Bytes	Binary Offset
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+20+ (#recsx12)
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.53 GLORAWFRAME

#### Raw GLONASS L1 C/A frame data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw GLONASS L1 C/A frame data as received from the GLONASS satellite. Multiple messages are transmitted, one for each SVID with data.

**Message ID:** 721

**Log Type:** Asynch

**Recommended Input:**

```
log glorawframea onchanged
```

**Example:**

```
#GLORAWFRAMEA,COM1,19,53.0,SATTIME,1340,398773.000,02000000,8792,2020;

```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	GLORAWFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	frame#	Frame number	Ulong	4	H
3	sloto	Slot information offset - PRN identification (Slot + 37). Ephemeris relates to this slot and is also called SLOTO in NovAtel Connect.	Ushort	2	H+4
4	freqo	Frequency channel offset in the range 0 to 20	Ushort	2	H+6
5	week	GPS Week, in weeks	Ulong	4	H+8
6	time	GPS Time, in milliseconds (binary data) or seconds (ASCII data)	GPSec	4	H+12
7	frame decode	Frame decoder number	Ulong	4	H+16
8	sigchan	Signal channel number	Ulong	4	H+20
9	#recs	Number of records to follow	Ulong	4	H+24

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	string	GLONASS data string	String [11]	11	H+28
11	Reserved		Uchar	1	H+39
12	Next record offset = H+28+ (#recs x 12)				
13	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H +28+ (#recs x 12)
14	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.54 GLORAWSTRING

### *Raw GLONASS L1 C/A string*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw L1 C/A string data as received from the GLONASS satellite.

**Message ID:** 722

**Log Type:** Asynch

**Recommended Input:**

```
log glorawstringa onchanged
```

**Example:**

```
#GLORAWSTRINGA, COM1, 0, 51.0, SATTIME, 1340, 399113.000, 02000000, 50ac, 2020;
4, 6, 061000000000000000000004f, 0*5b215fb2
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	GLORAWSTRING header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	slot	Slot identification	Uchar	1	H
3	freq	Frequency channel (frequency channels are in the range -7 to +13)	Char	1	H+1
4	string	GLONASS data string	Hex [11]	11	H+2
5	Reserved		Uchar	1	H+13
6	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+14
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.55 GPALM

### *Almanac data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log outputs raw almanac data for each GPS satellite PRN contained in the broadcast message. A separate record is logged for each PRN, up to a maximum of 32 records. GPALM outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. UTC time is then set to VALID. It takes a minimum of 12.5 minutes to collect a complete almanac following receiver boot-up. In the case of a GLONASS capable receiver, the UTC offset can be determined once the GLONASS ephemeris is decoded, which takes about 50 seconds. If an almanac was stored in NVM, the stored values are reported in the GPALM log once time is set on the receiver.

To obtain copies of ICD-GPS-200, refer to <https://www.gps.gov/technical/icwg/>.

**Message ID:** 217

**Log Type:** Asynch

**Recommended Input:**

```
log gpalm onchanged
```

**Example:**

```
$GPALM,28,01,01,1337,00,305a,90,1b9d,fd5b,a10ce9,ba0a5e,2f48f1,cccb76,006,001*27

## 3.56 GPGGA

### *GPS fix data and undulation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains time, position and fix related data of the GNSS receiver. See also *Table 109: Position Precision of NMEA Logs* on page 524.

The GPGGA log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

The GPGGA log can be customized using the **NMEAFORMAT** command (see page 235).

The position for the **GPGGA** log is reported in the user selected datum. See the **DATUM** command on page 119 for more details.

When the solution type is INS (SPAN models), the DOPs in the **GPGGA** log are calculated at a 1 Hz rate.  
To determine if the receiver is providing an INS solution, check the **pos type** field in the **BESTPOS** log (see page 429).

**Message ID: 218**

**Log Type: Synch**

**Recommended Input:**

```
log gpgga ontime 1
```

**Example:**

```
$GPGGA,134658.00,5106.9792,N,11402.3003,W,2,09,1.0,1048.47,M,-16.27,M,08,AAAA*60
```

The NMEA (National Marine Electronics Association) has defined standards that specify how electronic equipment for marine users communicate. GNSS receivers are part of this standard and the NMEA has defined the format for several GNSS data logs otherwise known as 'sentences'.

Each NMEA sentence begins with a '\$' followed by a two-letter prefix identifying the type of sending device (for example 'GP', 'GL' or 'GN'), followed by a sequence of letters that define the type of information contained in the sentence. Data contained within the sentence is separated by commas and the sentence is terminated with a two digit checksum followed by a carriage return/line feed. Here is an example of a NMEA sentence describing time, position and fix related data:

```
$GPGGA,134658.00,5106.9792,N,11402.3003,W,2,09,1.0,1048.47,M,
-16.27,M,08,AAAA*60
```

The GPGGA sentence shown above and other NMEA logs are output the same no matter what GNSS receiver is used, providing a standard way to communicate and process GNSS information. For more information about NMEA, see the **NMEATALKER** command on page 238.

Field	Structure	Description	Symbol	Example
1	\$GPGGA	Log header. See <i>Messages</i> on page 30 for more information.		\$GPGGA
2	utc	UTC time status of position (hours/minutes/seconds/ decimal seconds)	hhmmss.ss	202134.00
3	lat	Latitude (DDmm.mm)	IIII.II	5106.9847
4	lat dir	Latitude direction (N = North, S = South)	a	N
5	lon	Longitude (DDDmm.mm)	yyyyy.yy	11402.2986
6	lon dir	Longitude direction (E = East, W = West)	a	W
7	quality	refer to <i>Table 107: GPS Quality Indicators</i> on the next page	x	1
8	# sats	Number of satellites in use. May be different to the number in view	xx	10
9	hdop	Horizontal dilution of precision	x.x	1.0
10	alt	Antenna altitude above/below mean sea level	x.x	1062.22
11	a-units	Units of antenna altitude (M = meters)	M	M
12	undulation	Undulation - the relationship between the geoid and the WGS84 ellipsoid	x.x	-16.271
13	u-units	Units of undulation (M = meters)	M	M
14	age	Age of correction data (in seconds) The maximum age reported here is limited to 99 seconds.	xx	(empty when no differential data is present)

Field	Structure	Description	Symbol	Example
15	stn ID	Differential base station ID	xxxx	(empty when no differential data is present)
16	*xx	Check sum	*hh	*48
17	[CR][LF]	Sentence terminator		[CR][LF]

Table 107: GPS Quality Indicators

Indicator	Description
0	Fix not available or invalid
1	Single point
	Converging PPP (TerraStar-L)
2	Pseudorange differential
	Converged PPP (TerraStar-L)
	Converging PPP (TerraStar-C, TerraStar-C PRO, TerraStar-X)
4	RTK fixed ambiguity solution
5	RTK floating ambiguity solution
	Converged PPP (TerraStar-C, TerraStar-C PRO, TerraStar-X)
6	Dead reckoning mode
7	Manual input mode (fixed position)
8	Simulator mode
9	WAAS (SBAS) <sup>1</sup>

Refer to the **BESTPOS** log (see page 429) and *Table 85: Supplemental Position Types and NMEA Equivalents* on page 436.

<sup>1</sup>An indicator of 9 has been temporarily set for SBAS (NMEA standard for SBAS not decided yet). This indicator can be customized using the GGAQUALITY command.

## 3.57 GPGGALONG

### *Fix data, extra precision and undulation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains, time, position, undulation and fix related data of the GNSS receiver. This is output as a GPGGA log but the GPGGALONG log differs from the normal GPGGA log by its extra precision. See also *Table 109: Position Precision of NMEA Logs* on page 524.

The GPGGALONG log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

The GPGGALONG log can be customized using the **NMEAFORMAT** command (see page 235).

When the solution type is INS (SPAN models), the DOPs in the **GPGGALONG** log are calculated at a 1 Hz rate.  
To determine if the receiver is providing an INS solution, check the **pos type** field in the **BESTPOS** log (see page 429).

**Message ID:** 521

**Log Type:** Synch

**Recommended Input:**

```
log gpggalong ontime 1
```

**Example 1:**

```
$GPGGA,181126.00,5106.9802863,N,11402.3037304,W,7,11,0.9,1048.234,M,-16.27,M,,*51
```

**Example 2:**

```
$GPGGA,134658.00,5106.9802863,N,11402.3037304,W,2,09,1.0,1048.234,M,-16.27,M,08,AAAA
```

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPGGALONG	Log header		\$GPGGA
2	utc	UTC time status of position (hours/minutes/seconds/ decimal seconds)	hhmmss.ss	202126.00

Table 108: Position Precision of NMEA Logs

NMEA Log	Latitude (# of decimal places)	Longitude (# of decimal places)	Altitude (# of decimal places)
GPGGA	4	4	2
GPGGALONG	7	7	3
GPGLL	7	7	N/A
GPRMC	7	7	N/A

Refer to the **BESTPOS** log (see page 429) and *Table 85: Supplemental Position Types and NMEA Equivalents* on page 436.

## 3.58 GPGLL

### *Geographic position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains latitude and longitude of present vessel position, time of position fix and status.

*Table 109: Position Precision of NMEA Logs* on the next page compares the position precision of selected NMEA logs.

The GPGLL log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

The position for the **GPGLL** log is reported in the user selected datum. See the **DATUM** command on page 119 for more details.

**Message ID:** 219

**Log Type:** Synch

**Recommended Input:**

```
log gppll ontime 1
```

**Example 1 (GPS only):**

```
$GPGLL,5107.0013414,N,11402.3279144,W,205412.00,A,A*73
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNGLL,5107.0014143,N,11402.3278489,W,205122.00,A,A*6E
```

See the Note in the **GPGLL** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Example
1	\$GPGLL	Log header. See <i>Messages</i> on page 30 for more information.	\$GPGLL
2	lat	Latitude (DDmm.mm)	5106.7198674
3	lat dir	Latitude direction (N = North, S = South)	N

Field	Structure	Description	Example
4	lon	Longitude (DDDmm.mm)	11402.3587526
5	lon dir	Longitude direction (E = East, W = West)	W
6	utc	UTC time status of position (hours/minutes/seconds/decimal seconds)	220152.50
7	data status	Data status: A = Data valid, V = Data invalid	A
8	mode ind	Positioning system mode indicator, see <i>Table 110: NMEA Positioning System Mode Indicator</i> below	A
9	*xx	Check sum	*1B
10	[CR][LF]	Sentence terminator	[CR][LF]

Table 109: Position Precision of NMEA Logs

NMEA Log	Latitude (# of decimal places)	Longitude (# of decimal places)	Altitude (# of decimal places)
GPGGA	4	4	2
GPGGALONG	7	7	3
GPGLL	7	7	N/A
GPRMC	7	7	N/A

Table 110: NMEA Positioning System Mode Indicator

Mode	Indicator
A	Autonomous
D	Differential
E	Estimated (dead reckoning) mode
M	Manual input
N	Data not valid

## 3.59 GPGRS

### *GPS range residuals for each satellite*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Range residuals can be computed in two ways, and this log reports those residuals. Under mode 0, residuals output in this log are used to update the position solution output in the GPGGGA message. Under mode 1, the residuals are recomputed after the position solution in the GPGGGA message is computed. The receiver computes range residuals in mode 1. An integrity process using GPGRS would also require GPGGGA (for position fix data), GPGSA (for DOP figures) and GPGSV (for PRN numbers) for comparative purposes.

The GPGRS log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

1. If the range residual exceeds  $\pm 99.9$ , then the decimal part is dropped. Maximum value for this field is  $\pm 999$ . The sign of the range residual is determined by the order of parameters used in the calculation as follows:

$$\text{range residual} = \text{calculated range} - \text{measured range}$$

2. If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GB/BD (BDS satellites only), GQ (QZSS satellites only), GI (NavIC satellites only) or GN (combined system satellites).

The position for the **GPRMC** log is reported in the user selected datum. See the **DATUM** command on page 119 for more details.

**Message ID:** 220

**Log Type:** Synch

**Recommended Input:**

```
log gpgrs ontime 1
```

**Example 1 (NMEATALKER set to GP; GPS only):**

```
$GPGRS,174926.00,1,0.2,0.6,0.1,1.0,-0.4,0.3,-1.0,0.8,-0.3,-3.0,0.1,,1,0*65
```

**Example 2 (NMEATALKER set to AUTO; Combined GPS, GLONASS, GALILEO, BDS, and NavIC):**

```
$GNGRS,174847.00,1,-0.0,0.7,0.3,1.0,-0.3,0.2,-1.3,0.7,-0.1,-3.0,0.0,,1,0*58
```

```
$GNGRS,174847.00,1,7.0,-4.3,4.7,-3.2,0.0,-1.7,-3.2,,,,,2,0*70
```

```
$GNGRS,174847.00,1,-0.1,-0.5,0.7,-0.2,2.1,-0.9,-0.5,-0.7,0.3,,,,,3,0*7E
```

```
$GNGRS,174847.00,1,-0.1,1.3,-1.1,,,,,,,4,0*70
```

```
$GNGRS,174847.00,1,-0.7,,,,,,,6,0*5B
```

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPRGS	Log header. See <i>Messages</i> on page 30 for more information.		\$GPRGS
2	utc	UTC time status of position (hours/minutes/seconds/decimal seconds)	hhmmss.ss	192911.0
3	mode	Mode 0= residuals were used to calculate the position given in the matching GGA line (apriori) (not used by OEM7 receivers) Mode 1= residuals were recomputed after the GGA position was computed (preferred mode)	x	1
4 - 15	res	Range residuals for satellites used in the navigation solution. Order matches order of PRN numbers in GPGSA	x.x,x.x,.....	-13.8,- 1.9,11.4,- 33.6,0.9, 6.9,- 12.6,0.3,0.6, -22.3
16	system ID	GNSS system ID. See <i>Table 111: System and Signal IDs</i> on the next page. This field is only output if the NMEAVERSION is 4.11 (see the <b>NMEAVERSION</b> command on page 240).	h	1
17	signal ID	ID of the ranging signal. See <i>Table 111: System and Signal IDs</i> on the next page	h	1

## 3.60 GPGSA

### *GPS DOP and active satellites*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains GNSS receiver operating mode, satellites used for navigation and DOP values.

The GPGSA log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), or GN (satellites from multiple systems) or GA (Galileo satellites only).

When the solution type is INS (SPAN models), the DOPs in the **GPGGA** log are calculated at a 1 Hz rate. To determine if the receiver is providing an INS solution, check the **pos type** field in the **BESTPOS** log (see page 429).

**Message ID:** 221

**Log Type:** Synch

**Recommended Input:**

```
log gpgsa ontime 1
```

**Example 1 (GPS only):**

```
$GPGSA,M,3,17,02,30,04,05,10,09,06,31,12,,,1.2,0.8,0.9*35
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNGSA,M,3,17,02,30,04,05,10,09,06,31,12,,,1.2,0.8,0.9*2B
```

```
$GNGSA,M,3,87,70,,,,,,,,,,,,,1.2,0.8,0.9*2A
```

The DOPs provide a simple characterization of the user satellite geometry. DOP is related to the volume formed by the intersection points of the user satellite vectors, with the unit sphere centered on the user. Larger volumes give smaller DOPs. Lower DOP values generally represent better position accuracy. The role of DOP in GNSS positioning is often misunderstood. A lower DOP value does not automatically mean a low position error. The quality of a GNSS derived position estimate depends upon both the measurement geometry as represented by DOP values and range errors caused by signal strength, ionospheric effects, multipath and so on.

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPGSA	Log header. See <i>Messages</i> on page 30 for more information.		\$GPGSA
2	mode MA	A = Automatic 2D/3D M = Manual, forced to operate in 2D or 3D	M	M
3	mode 123	Mode: 1 = Fix not available; 2 = 2D; 3 = 3D	x	3
4 - 15	prn	PRN numbers of satellites used in solution (null for unused fields), total of 12 fields GPS = 1 to 32 SBAS = 33 to 64 (add 87 for PRN number) GLO = 65 to 96 <sup>1</sup>	xx,xx,.....	18,03,13, 25,16, 24,12, 20,,,,
16	pdop	Position dilution of precision	x.x	1.5
17	hdop	Horizontal dilution of precision	x.x	0.9
18	vdop	Vertical dilution of precision	x.x	1.2
19	system ID	GNSS system ID. See <i>Table 111: System and Signal IDs</i> on page 527. This field is only output if the NMEAVERSION is 4.11 (see the <b>NMEAVERSION</b> command on page 240).		
20	*xx	Check sum	*hh	*3F
21	[CR][LF]	Sentence terminator		[CR][LF]

<sup>1</sup>The NMEA GLONASS PRN numbers are 64 plus the GLONASS slot number. Current slot numbers are 1 to 24 which give the range 65 to 88. PRN numbers 89 to 96 are available if slot numbers above 24 are allocated to on-orbit spares.

## 3.61 GPGST

### *Estimated error in position solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains pseudorange measurement noise statistics are translated in the position domain in order to give statistical measures of the quality of the position solution.

This log reflects the accuracy of the solution type used in the **BESTPOS** log (see page 429) and **GPGGA** log (see page 517), except for the RMS field. The RMS field, since it specifically relates to pseudorange inputs, does not represent carrier-phase based positions. Instead, it reflects the accuracy of the pseudorange position which is given in the **PSRPOS** log (see page 674).

The GPGST log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only) or GN (satellites from multiple systems) or GA (Galileo satellites only).

**Message ID: 222**

**Log Type: Synch**

**Recommended Input:**

```
log gpgst ontime 1
```

**Example 1 (GPS only):**

```
$GPGST,141451.00,1.18,0.00,0.00,0.0000,0.00,0.00,0.00*6B
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNGST,143333.00,7.38,1.49,1.30,68.1409,1.47,1.33,2.07*4A
```

1. See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.
2. Accuracy is based on statistics, reliability is measured in percent. When a receiver can measure height to one meter, this is an accuracy. Usually this is a one sigma value (one SD). A one sigma value for height has a reliability of 68%, that is, the error is less than one meter 68% of the time. For a more realistic accuracy, double the one sigma value (1 m) and the result is 95% reliability (error is less than 2 m 95% of the time). Generally, GNSS heights are 1.5 times poorer than horizontal positions.

As examples of statistics, the GPGST message and NovAtel performance specifications use Root Mean Square (RMS). Specifications may be quoted in CEP:

- RMS - root mean square (a probability level of 68%)
- CEP - circular error probable (the radius of a circle such that 50% of a set of events occur inside the boundary)

Field	Structure	Description	Symbol	Example
1	\$GPGST	Log header. See <i>Messages</i> on page 30 for more information.		\$GPGST
2	utc	UTC time status of position (hours/minutes/seconds/ decimal seconds)	hhmmss.ss	173653.00
3	rms	RMS value of the standard deviation of the range inputs to the navigation process. Range inputs include pseudoranges and DGPS corrections	x.x	2.73
4	smjr std	Standard deviation of semi-major axis of error ellipse (m)	x.x	2.55
5	smnr std	Standard deviation of semi-minor axis of error ellipse (m)	x.x	1.88
6	orient	Orientation of semi-major axis of error ellipse (degrees from true north)	x.x	15.2525
7	lat std	Standard deviation of latitude error (m)	x.x	2.51
8	lon std	Standard deviation of longitude error (m)	x.x	1.94
9	alt std	Standard deviation of altitude error (m)	x.x	4.30
10	*xx	Check sum	*hh	*6E
11	[CR][LF]	Sentence terminator		[CR][LF]

## 3.62 GPGSV

### *GPS satellites in view*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the number of GPS SVs in view, PRN numbers, elevation, azimuth and SNR value. Each message includes up to four satellites. If there are more than four satellites in view, additional messages are transmitted. The total number of messages and the message number are included in each message.

The GPGSV log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

1. Satellite information may require the transmission of multiple messages. The first field specifies the total number of messages, minimum value 1. The second field identifies the order of this message (message number), minimum value 1.
2. If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems). Each system is output in a separate message.
3. The ID setting in the **NMEATALKER** command (see page 238) controls the satellites reported in this log. If the NMEATALKER ID is set to GP, only GPS satellites are reported in this log. If the NMEATALKER ID is set to AUTO, all satellites in view are reported.
4. A variable number of 'PRN-Elevation-Azimuth-SNR' sets are allowed up to a maximum of four sets per message. Null fields are not required for unused sets when less than four sets are transmitted.

**Message ID:** 223

**Log Type:** Synch

**Recommended Input:**

```
log gpgsv ontime 1
```

**Example (Including GPS and GLONASS sentences):**

```
$GPGSV,3,1,11,18,87,050,48,22,56,250,49,21,55,122,49,03,40,284,47*78
```

```
$GPGSV,3,2,11,19,25,314,42,26,24,044,42,24,16,118,43,29,15,039,42*7E
```

```
$GPGSV,3,3,11,09,15,107,44,14,11,196,41,07,03,173,*4D
```

```
$GLGSV,2,1,06,65,64,037,41,66,53,269,43,88,39,200,44,74,25,051,*64
```

```
$GLGSV,2,2,06,72,16,063,35,67,01,253,*66
```

The GPGSV log can be used to determine which GPS satellites are currently available to the receiver. Comparing the information from this log to that in the GPGSA log shows if the receiver is tracking all available satellites.

See also the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPGSV	Log header. See <i>Messages</i> on page 30 for more information.		\$GPGSV
2	# msg#	Total number of messages (1-9)	x	3
3	msg #	Message number (1-9)	x	1
4	# sats	Total number of satellites in view. May be different than the number of satellites in use (see also the <b>GPGGA</b> log on page 517)	xx	09
5	prn	Satellite PRN number GPS = 1 to 32 Galileo = 1 to 36 Beidou = 1 to 63 NAVIC = 1 to 14 QZSS = 1 to 10 SBAS = 33 to 64 (add 87 for PRN#s) GLO = 65 to 96 <sup>1</sup>	xx	03
6	elev	Elevation, degrees, 90 maximum	xx	51
7	azimuth	Azimuth, degrees True, 000 to 359	xxx	140
8	SNR	SNR (C/No) 00-99 dB, null when not tracking	xx	42
...	...	Next satellite PRN number, elev, azimuth, SNR,		
...	...	...		
...	...	Last satellite PRN number, elev, azimuth, SNR,		
variable	system ID	GNSS system ID. See <i>Table 111: System and Signal IDs</i> on page 527. This field is only output if the NMEAVERSION is 4.11 (see the <b>NMEAVERSION</b> command on page 240).		
variable	*xx	Check sum	*hh	*72
variable	[CR][LF]	Sentence terminator		[CR][LF]

<sup>1</sup>The NMEA GLONASS PRN numbers are 64 plus the GLONASS slot number. Current slot numbers are 1 to 24 which give the range 65 to 88. PRN numbers 89 to 96 are available if slot numbers above 24 are allocated to on-orbit spares.

## 3.63 GPHDT

### *NMEA heading log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains actual vessel heading in degrees True (from True North). See also a description of heading in the **HEADING2** log on page 553. You can also set a standard deviation threshold for this log, see the **HDTOUTTHRESHOLD** command on page 185.

You must have an ALIGN capable receiver to use this log.

The GPHDT log can only be logged using the ONCHANGED trigger. Other triggers, such as ONTIME are not accepted.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

**Message ID:** 1045

**Log Type:** Asynch

**Recommended Input:**

```
log gphdt onchanged
```

**Example 1 (GPS only):**

```
$GPHDT,75.5664,T*36
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNHDT,75.5554,T*45
```

Field	Structure	Description	Symbol	Example
1	\$GPHDT	Log header. See <i>Messages</i> on page 30 for more information.		\$GPHDT
2	heading	Heading in degrees	x.x	75.5554
3	True	Degrees True	T	T
4	*xx	Check sum	*hh	*36
5	[CR][LF]	Sentence terminator		[CR][LF]

## 3.64 GPHDTDUALANTENNA

### *Synchronous NMEA heading log*

**Platform:** OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2, SPAN CPT7

This log contains actual vessel heading in degrees True (from True North). It provides the same information as the **GPHDT** log (see page 536), but with synchronous output.

You must have an ALIGN capable, dual antenna receiver to use this log.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

**Message ID:** 2045

**Log Type:** Synch

**Recommended Input:**

```
log gphdtdualantenna ontime 1
```

**Example 1 (GPS only):**

```
$GPHDT,75.5664,T*36
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNHDT,75.5554,T*45
```

Field	Structure	Description	Symbol	Example
1	\$GPHDT	Log header. See <i>Messages</i> on page 30 for more information.		\$GPHDT
2	heading	Heading in degrees	x.x	75.5554
3	True	Degrees True	T	T
4	*xx	Check sum	*hh	*36
5	[CR][LF]	Sentence terminator		[CR][LF]

## 3.65 GPRMB

### *Navigation information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log contains navigation data from present position to a destination waypoint. The destination is set active by the receiver **SETNAV** command (see page 331).

The GPRMB log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

**Message ID:** 224

**Log Type:** Synch

**Recommended Input:**

```
log gprmb ontime 1
```

**Example 1 (GPS only):**

```
$GPRMB,A,5.14,L,FROM,TO,5109.7578000,N,11409.0960000,W,5.1,303.0,-0.0,V,A*6F
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNRMB,A,5.14,L,FROM,TO,5109.7578000,N,11409.0960000,W,5.1,303.0,-0.0,V,A*71
```

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Field Description	Symbol	Example
1	\$GPRMB	Log header. See <i>Messages</i> on page 30 for more information.		\$GPRMB
2	data status	Data status: A = data valid; V = navigation receiver warning	A	A

Field	Structure	Field Description	Symbol	Example
3	xtrack	<p>Cross track error</p> <p>Represents the track error from the intended course</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">  If the cross track error exceeds 9.99 NM, displays 9.99.         </div> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">  One nautical mile (NM) = 1,852 meters.         </div>	x.x	5.14
4	dir	<p>Direction to steer to get back on track (L/R)</p> <p>Direction to steer is based on the sign of the crosstrack error, that is,            L = xtrack error (+)            R = xtrack error (-)</p>	a	L
5	origin ID	Origin waypoint ID	c--c	FROM
6	dest ID	Destination waypoint ID	c--c	TO
7	dest lat	Destination waypoint latitude (DDmm.mm)	IIII.II	5109.7578000
8	lat dir	Latitude direction (N = North, S = South)	a	N
9	dest lon	Destination waypoint longitude (DDDmm.mm)	yyyyy.yy	11409.0960000
10	lon dir	Longitude direction (E = East, W = West)	a	W
11	range	<p>Range to destination, nautical miles</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">  If the range to destination exceeds 999.9 NM, displays 999.9.         </div>	x.x	5.1
12	bearing	Bearing to destination, degrees True	x.x	303.0
13	vel	Destination closing velocity, knots	x.x	-0.0
14	arr status	<p>Arrival status:</p> <p>A = perpendicular passed</p> <p>V = destination not reached or passed</p>	A	V
15	mode ind	Positioning system mode indicator, see <i>Table 112: NMEA Positioning System Mode Indicator</i> on the next page	a	A
16	*xx	Check sum	*hh	*6F
17	[CR][LF]	Sentence terminator		[CR][LF]

The fields *origin ID*, *dest ID*, *dest lat*, *lat dir*, *dest lon* and *lon dir* are tagged from the **SETNAV** command (see page 331).

**Table 112: NMEA Positioning System  
Mode Indicator**

Mode	Indicator
A	Autonomous
D	Differential
E	Estimated (dead reckoning) mode
M	Manual input
N	Data not valid

## 3.66 GPRMC

### *GPS specific information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains time, date, position, track made good and speed data provided by the GPS navigation receiver. RMC and RMB are the recommended minimum navigation data to be provided by a GNSS receiver.

A comparison of the position precision between this log and other selected NMEA logs can be seen in *Table 109: Position Precision of NMEA Logs* on page 524.

The GPRMC log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

The position for the **GPRMC** log is reported in the user selected datum. See the **DATUM** command on page 119 for more details.

**Message ID:** 225

**Log Type:** Synch

**Recommended Input:**

```
log gprmc ontime 1
```

**Example 1 (GPS):**

```
$GPRMC,144326.00,A,5107.0017737,N,11402.3291611,W,0.080,323.3,210307,0.0,E,A*20
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNRMC,143909.00,A,5107.0020216,N,11402.3294835,W,0.036,348.3,210307,0.0,E,A*31
```

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Field Description	Symbol	Example
1	\$GPRMC	Log header. See <i>Messages</i> on page 30 for more information.		\$GPRMC
2	utc	UTC of position	hhmmss.ss	144326.00

Field	Structure	Field Description	Symbol	Example
3	pos status	Position status (A = data valid, V = data invalid)	A	A
4	lat	Latitude (DDmm.mm)	III.II	5107.0017737
5	lat dir	Latitude direction: (N = North, S = South)	a	N
6	lon	Longitude (DDDmm.mm)	yyyyy.yy	11402.3291611
7	lon dir	Longitude direction: (E = East, W = West)	a	W
8	speed Kn	Speed over ground, knots	x.x	0.080
9	track true	Track made good, degrees True	x.x	323.3
10	date	Date: dd/mm/yy	xxxxxx	210307
11	mag var	Magnetic variation, degrees Note that this field is the actual magnetic variation and will always be positive. The direction of the magnetic variation is always positive.	x.x	0.0
12	var dir	Magnetic variation direction E/W Easterly variation (E) subtracts from True course. Westerly variation (W) adds to True course.	a	E
13	mode ind	Positioning system mode indicator, see <i>Table 113: NMEA Positioning System Mode Indicator</i> below	a	A
14	*xx	Check sum	*hh	*20
15	[CR][LF]	Sentence terminator		[CR][LF]

**Table 113: NMEA Positioning System Mode Indicator**

Mode	Indicator

M	Manual input
N	Data not valid

## 3.67 GPSCNAVRAWMESSAGE

### GPS CNAV Raw Message

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log provides the raw CNAV message from signals which contain the CNAV message (L2C, L5). It also indicates whether the raw message is generated from an L2C signal or L5 signal.

The **GPSCNAVRAWMESSAGE** log is not output by default. To receive this log, data decoding for L2C or L5 must be enabled using the **DATADECODESIGNAL** command (see page 115) for the specific signal.

**Message ID:** 2262

**Log Type:** Asynch

**Recommended Input:**

```
log gpscnavrawmessagea onnew
```

**ASCII Example:**

```
#GPSCNAVRAWMESSAGEA,COM1,0,82.5,SATTIME,2020,252582.000,02000020,06c3,32768;
185,8,GPSL5,11,8b20b52391ac86ea3ac949e16706c0b2e089dff9600320045e2013a780317
1003c2f11485870*35aaa6c3
```

```
#GPSCNAVRAWMESSAGEA,COM1,0,81.5,SATTIME,2020,252576.000,02000020,06c3,32768;
178,10,GPSL2C,10,8b28a52390fc85777dad008893a00013232e8fffeb5c6df0cd300fa631c

## 3.68 GPSEPHEM

### *Decoded GPS L1 C/A ephemerides*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains a single set of GPS ephemeris parameters.

**Message ID:** 7

**Log Type:** Asynch

**Recommended Input:**

```
log gpsephema onchanged
```

**ASCII Example:**

```

```

The GPSEPHEM log can be used to monitor changes in the orbits of GPS satellites.

To obtain copies of IS-GPS-200, refer to the GPS website  
(<https://www.gps.gov/technical/icwg/>).

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	GPSEPHHEM header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PRN	Satellite PRN number	Ulong	4	H
3	tow	Time stamp of subframe 1 (s)	Double	8	H+4
4	health	Health status - a 6-bit health code as defined in IS-GPS-200	Ulong	4	H+12
5	IODE1	Issue of ephemeris data 1	Ulong	4	H+16
6	IODE2	Issue of ephemeris data 2	Ulong	4	H+20
7	week	toe week number (computed from Z count week)	Ulong	4	H+24
8	z week	Z count week number. This is the week number from subframe 1 of the ephemeris. The 'toe week' (field #7) is derived from this to account for rollover	Ulong	4	H+28
9	toe	Reference time for ephemeris (s)	Double	8	H+32
10	A	Semi-major axis (m)	Double	8	H+40
11	$\Delta N$	Mean motion difference (radians/s)	Double	8	H+48
12	$M_0$	Mean anomaly of reference time (radians)	Double	8	H+56
13	ecc	Eccentricity, dimensionless	Double	8	H+64
14	$\omega$	Argument of perigee (radians)	Double	8	H+72
15	cuc	Amplitude of cosine harmonic correction term to the argument of latitude (radians)	Double	8	H+80
16	cus	Amplitude of sine harmonic correction term to the argument of latitude (radians)	Double	8	H+88
17	crc	Amplitude of cosine harmonic correction term to the orbit radius (m)	Double	8	H+96
18	crs	Amplitude of sine harmonic correction term to the orbit radius (m)	Double	8	H+104
19	cic	Amplitude of cosine harmonic correction term to the angle of inclination (radians)	Double	8	H+112
20	cis	Amplitude of sine harmonic correction term to the angle of inclination (radians)	Double	8	H+120
21	$l_0$	Inclination angle at reference time (radians)	Double	8	H+128
22	$l^0$	Rate of inclination angle (radians/s)	Double	8	H+136
23	$\omega_0$	Right ascension (radians)	Double	8	H+144

Field	Field type	Description	Format	Binary Bytes	Binary Offset
24	$\dot{\omega}$	Rate of right ascension (radians/s)	Double	8	H+152
25	iodc	Issue of data clock	Ulong	4	H+160
26	toc	SV clock correction term (s)	Double	8	H+164
27	tgd	Estimated group delay difference (s)	Double	8	H+172
28	$a_{f0}$	Clock aging parameter (s)	Double	8	H+180
29	$a_{f1}$	Clock aging parameter (s/s)	Double	8	H+188
30	$a_{f2}$	Clock aging parameter (s/s/s)	Double	8	H+196
31	AS	Anti-spoofing on: 0 = FALSE 1 = TRUE	Bool	4	H+204
32	N	Corrected mean motion (radians/s)   This field is computed by the receiver.	Double	8	H+208
33	URA	User Range Accuracy variance (m) <sup>2</sup>  The ICD specifies that the URA index transmitted in the ephemerides can be converted to a nominal standard deviation value using an algorithm listed there. We publish the square of the nominal value (variance). The correspondence between the original URA index and the value output is shown in <i>Table 115: URA Variance</i> below	Double	8	H+216
34	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+224
35	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 115: URA Variance

Index Value (m)	A: Standard Deviations (m)	Variance: A <sup>2</sup> (m <sup>2</sup> )
0	2.0	4
1	2.8	7.84
2	4.0	16
3	5.7	32.49
4	8	64
5	11.3	127.69
6	16.0	256

<b>Index Value (m)</b>	<b>A: Standard Deviations (m)</b>	<b>Variance: A<sup>2</sup> (m<sup>2</sup>)</b>
7	32.0	1024
8	64.0	4096
9	128.0	16384

14	4096.0	16777216
15	8192.0	67108864

## 3.69 GPVTG

### *Track made good and ground speed*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the track made good and speed relative to the ground.

The GPVTG log outputs these messages without waiting for a valid almanac. Instead, it uses a UTC time, calculated with default parameters. In this case, the UTC time status (see the **TIME** log on page 854) is set to WARNING since it may not be one hundred percent accurate. When a valid almanac is available, the receiver uses the real parameters. Then the UTC time status is set to VALID.

**Message ID:** 226

**Log Type:** Synch

**Recommended Input:**

```
log gpvtg ontime 1
```

**Example 1 (GPS only):**

```
$GPVTG,172.516,T,155.295,M,0.049,N,0.090,K,D*2B
```

**Example 2 (Combined GPS and GLONASS):**

```
$GNVTG,134.395,T,134.395,M,0.019,N,0.035,K,A*33
```

If the **NMEATALKER** command (see page 238) is set to AUTO, the talker (the first 2 characters after the \$ sign in the log header) is set to GP (GPS satellites only), GL (GLONASS satellites only), GA (Galileo satellites only), GQ (for QZSS satellites only), GB/BD (for BeiDou satellites only) or GN (satellites from multiple systems).

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPVTG	Log header. See <i>Messages</i> on page 30 for more information.		\$GPVTG
2	track true	Track made good, degrees True	x.x	24.168
3	T	True track indicator	T	T
4	track mag	Track made good, degrees Magnetic; Track mag = Track true + (MAGVAR correction) See the <b>MAGVAR</b> command on page 225	x.x	24.168
5	M	Magnetic track indicator	M	M
6	speed Kn	Speed over ground, knots	x.x	0.4220347

Field	Structure	Description	Symbol	Example
7	N	Nautical speed indicator (N = Knots)	N	N
8	speed Km	Speed, kilometers/hour	x.x	0.781608
9	K	Speed indicator (K = km/hr)	K	K
10	mode ind	Positioning system mode indicator, see <i>Table 116: NMEA Positioning System Mode Indicator</i> below	a	A
11	*xx	Check sum	*hh	*7A
12	[CR][LF]	Sentence terminator		[CR][LF]

**Table 116: NMEA Positioning System Mode Indicator**

Mode	Indicator
A	Autonomous
D	Differential
E	Estimated (dead reckoning) mode
M	Manual input
N	Data not valid

## 3.70 GPZDA

### UTC time and date

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The GPZDA log outputs the UTC date and time. If no valid almanac is stored in the receiver, a default UTC offset is used to generate the time until a new almanac is downloaded. If the offset is not up-to-date, this initial UTC time may be incorrect until the new almanac is present.

**Message ID:** 227

**Log Type:** Synch

**Recommended Input:**

```
log gpzda ontime 1
```

**Example:**

```
$GPZDA,143042.00,25,08,2005,,*6E
```

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

Field	Structure	Description	Symbol	Example
1	\$GPZDA	Log header. See <i>Messages</i> on page 30 for more information.		\$GPZDA
2	utc	UTC time status	hhmmss.ss	220238.00
3	day	Day, 01 to 31	xx	15
4	month	Month, 01 to 12	xx	07
5	year	Year	xxxx	1992
6	null	Local zone description—not available  Local time zones are not supported by OEM7 family receivers. Fields 6 and 7 are always null.	xx	(empty when no data is present)

8	*xx	Check sum	*hh	*6F
9	[CR][LF]	Sentence terminator		[CR][LF]

## 3.71 HEADING2

### *Heading information with multiple rovers*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The heading is the angle from True North of the base to rover vector in a clockwise direction. This log can be output at both Master and Rover ends.

An ALIGN capable receiver is required to use this log.

Asynchronous logs, such as HEADING2, should only be logged ONCHANGED or ONNEW otherwise the most current data is not available or included in the output. An example of this occurrence is in the ONTIME trigger. If this trigger is not logged ONNEW or ONCHANGED, it may cause inaccurate time tags.

The HEADING2 log is dictated by the output frequency of the master receiver sending out RTCAOBS2, RTCAOBS3 or NOVATELXOBS messages. HEADING2 supports 20 Hz output rate. Ensure sufficient radio bandwidth is available between the ALIGN Master and the ALIGN Rover.

**Message ID:** 1335

**Log Type:** Asynch

**Recommended Input:**

```
log heading2a onnew
```

**ASCII Example:**

```
#HEADING2A, COM1, 0, 39.5, FINESTEERING, 1622, 422892.200, 02040000, f9bf, 6521;
SOL_COMPUTED, NARROW_INT, 0.927607417, 178.347869873, -1.3037414550.0, 0.261901051,
0.391376048, "R222", "AAAA", 18, 17, 17, 16, 0, 01, 0, 33*7be836f6
```

Field	Field type	Description	Binary Format	Binary Bytes	Binary Offset
1	HEADING2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol stat	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4

Field	Field type	Description	Binary Format	Binary Bytes	Binary Offset
4	length	Baseline length in meters For ALIGN Heading models with position access, this field is -1. For ALIGN Heading models without position access, this field is only the decimal portion of the baseline in meters. For ALIGN Relative Positioning models receiving corrections from a master with a fixed position, this field is -1. For ALIGN Relative Positioning models receiving corrections from a master in moving baseline mode, this field is the complete baseline length in meters.	Float	4	H+8
5	heading	Heading in degrees (0° to 359.999°)	Float	4	H+12
6	pitch	Pitch (±90 degrees)	Float	4	H+16
7	Reserved		Float	4	H+20
8	hdg std dev	Heading standard deviation in degrees	Float	4	H+24
9	ptch std dev	Pitch standard deviation in degrees	Float	4	H+28
10	rover stn ID	Rover Receiver ID Set using the <b>SETROVERID</b> command (see page 333) on the Rover e.g. setroverid RRRR	Char[4]	4	H+32
11	Master stn ID	Master Receiver ID Set using the <b>DGPSTXID</b> command (see page 124) on the Master Default: AAAA	Char[4]	4	H+36
12	#SVs	Number of satellites tracked	Uchar	1	H+40
13	#solnSVs	Number of satellites used in solution	Uchar	1	H+41
14	#obs	Number of satellites above the elevation mask angle	Uchar	1	H+42
15	#multi	Number of satellites with multi-frequency signals above the mask angle	Uchar	1	H+43
16	sol source	Solution source (see <i>Table 117: Solution Source</i> on the next page)	Hex	1	H+44
17	ext sol stat	Extended solution status (see <i>Table 84: Extended Solution Status</i> on page 436)	Uchar	1	H+45

Field	Field type	Description	Binary Format	Binary Bytes	Binary Offset
18	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+46
19	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+47
20	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+48
21	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 117: Solution Source**

Bit	Mask	Description
0-1	0x03	Reserved
2-3	0x0C	Source antenna 0 = Primary antenna 1 = Secondary antenna
4-7	0xF0	Reserved

## 3.72 HEADINGEXT

### *Extended heading log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

HEADINGEXT is a proprietary message sent from the rover receiver to the master receiver in an ALIGN or Relative INS configuration. This message provides the position information from the rover receiver that the master receiver requires to produce an ALIGN or Relative INS solution.

**Message ID:** 1132

**Log Type:** Asynch

**Recommended Input:**

```
log com2 headingextb onnew
```

### 3.73 HEADINGEXT2

#### *Extended heading log in variable array form*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

HEADINGEXT2 is a proprietary message sent from the rover receiver to the master receiver in an ALIGN or Relative INS configuration. This message provides the position information from the rover receiver that the master receiver requires to produce an ALIGN or Relative INS solution.

**Message ID:** 1661

**Log Type:** Asynch

**Recommended Input:**

```
log com2 headingext2b onnew
```

## 3.74 HEADINGRATE

### Heading rate information

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log provides rate of change for the heading parameters. The heading is the angle from True North of the base to rover vector in a clockwise direction.

You must have an ALIGN capable receiver to use this log.

**Message ID:** 1698

**Log Type:** Asynch

**Recommended Input:**

```
log headingratea onchanged
```

**ASCII Example:**

```
#HEADINGRATEA, UNKNOWN, 0, 60.0, FINESTEERING, 1873, 411044.700, 02040008, c53a, 32768;  
SOL_COMPUTED, NARROW_INT, 0.025000000, 0.000000000, -0.308837891, 0.575313330,  
0.000000000, 1.264251590, 1.663657904, 0.0, "748M", "725U", 00, 0, 0, 0*66f97b96
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	HEADINGRATE header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol stat	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results.	Float	4	H+8
5	length rate	Rate of change of the baseline length in m/s. For Z ALIGN rovers, this field outputs the decimal portion of the baseline rate.	Float	4	H+12
6	heading rate	Rate of change of the heading in degrees/s	Float	4	H+16
7	pitch rate	Rate of change of the pitch in degrees/s	Float	4	H+20
8	length rate std dev	Baseline rate standard deviation in m/s	Float	4	H+24
9	heading rate std dev	Heading rate standard deviation in degrees/s	Float	4	H+28

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	pitch rate std dev	Pitch rate standard deviation in degrees/s	Float	4	H+32
11	Reserved		Float	4	H+36
12	rover stn ID	Rover Receiver ID Set using the <b>SETROVERID</b> command (see page 333) on the Rover receiver. For example, setroverid RRRR.	Uchar	4	H+40
13	master stn ID	Master Receiver ID Set using the <b>DGPSTXID</b> command (see page 124) on the Master receiver. Default: AAAA	Uchar	4	H+44
14	sol source	Solution source (see <i>Table 117: Solution Source</i> on page 555)	Hex	1	H+48
15	Reserved		Uchar	1	H+49
16	Reserved		Uchar	1	H+50
17	Reserved		Uchar	1	H+51
18	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+52
19	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.75 HEADINGSATS

### *Satellite used in heading solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log provides information on the satellites that are used in a heading solution.

The HEADINGSATS log can only be used from the ALIGN rover.

**Message ID:** 1316

**Log Type:** Asynch

**Recommended Input:**

```
log headingsatsa onnew
```

**ASCII Example:**

```
<HEADINGSATS COM1 0 86.5 FINESTEERING 2075 411685.000 02000020 f5b0 32768
< 17
< GPS 10 GOOD 00000003
< GPS 24 GOOD 00000003
< GPS 15 GOOD 00000003
< GPS 27 GOOD 00000003
< GPS 20 GOOD 00000003
< GPS 8 GOOD 00000003
< GPS 21 GOOD 00000003
< GPS 16 GOOD 00000003
< GPS 13 GOOD 00000003
< GLONASS 14-7 NODIFFCORR 00000000
< GLONASS 6-4 GOOD 00000001
< GLONASS 22-3 GOOD 00000003
< GLONASS 15 GOOD 00000003
< GLONASS 23+3 GOOD 00000003
< GLONASS 21+4 GOOD 00000003
< GLONASS 7+5 GOOD 00000003
< GLONASS 8+6 GOOD 00000003
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	HEADINGSATS	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	System	Refer to <i>Table 118: Satellite System</i> on the next page.	Enum	4	H+4

Field	Field type	Description	Format	Binary Bytes	Binary Offset
4	Satellite ID	In binary logs, the satellite ID field is 4 bytes. The 2 lowest-order bytes, interpreted as a USHORT, are the system identifier: for instance, the PRN for GPS, or the slot for GLONASS. The 2 highest-order bytes are the frequency channel for GLONASS, interpreted as a SHORT and zero for all other systems.  In ASCII and abbreviated ASCII logs, the satellite ID field is the system identifier. If the system is GLONASS and the frequency channel is not zero, then the signed channel is appended to the system identifier. For example, slot 13, frequency channel -2 is output as 13-2	Ulong	4	H+8
5	Status	See <i>Table 86: Observation Statuses</i> on page 438	Enum	4	H+12
6	Signal Mask	See <i>Table 87: GPS Signal Mask</i> on page 439, <i>Table 88: GLONASS Signal Mask</i> on page 439, <i>Table 89: Galileo Signal Mask</i> on page 440, <i>Table 90: BeiDou Signal Mask</i> on page 440, <i>QZSS Signal Mask</i> on page 440 and <i>NavIC Signal Mask</i> on page 440	Hex	4	H+16
7	Next satellite offset = H + 4 + (#sat x 16)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+ (#satx16)
9	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

Table 118: Satellite System

Binary Value	ASCII Mode Name
0	GPS
1	GLONASS
2	SBAS
5	Galileo
6	BeiDou
7	QZSS
9	NavIC

## 3.76 HWMONITOR

### Monitor hardware levels

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log allows the user to monitor temperature, antenna current and voltages.

**Message ID:** 963

**Log Type:** Polled

**Recommended Input:**

```
log hwmonitora ontime 10
```

**ASCII Example:**

```
#HWMONITORA,COM1,0,90.5,FINESTEERING,1928,153778.000,02000020,52db,32768;
7,43.284492493,100,0.000000000,200,5.094994068,700,1.195970654,800,3.279609442,
f00,1.811965823,1100,44.017093658,1600*52beac4b
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	HWMONITOR header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	# measurements	Number of measurements to follow	Ulong	4	H
3	reading	Temperature, antenna current or voltage reading Units: <ul style="list-style-type: none"> <li>• Degree Celsius for Temperature</li> <li>• Amps for Antenna Current</li> <li>• Volts for Voltage</li> </ul>	Float	4	H+4
4	status	See <i>Table 119: HWMONITOR Status Table</i> on the next page	HexUlong	4	H+8
5...	Next reading offset = H + 4 + (# measurements x 8)				
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+ (# measurements x 8)
7	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

Table 119: HWMONITOR Status Table

Bits	Description	Applicable Platforms
0-7	Boundary Limit Status (Hex): 0x00 = Value falls within acceptable bounds 0x01 = Value is under the lower warning limit 0x02 = Value is under the lower error limit 0x03 = Value is over the upper warning limit 0x04 = Value is over the upper error limit	
8-15	Reading Type (Hex):	
	0x00 = Reserved	
	0x01 = Temperature A temperature sensor is located on the receiver and provides the approximate temperature of the PCB surface near critical components (for example, CPU, TCXO) (degrees Celsius)	All
	0x02 = Antenna Current The amount of current being drawn by the active antenna (A)	All except OEM7500 and OEM7600
	0x06 = Digital Core 3V3 Voltage Internal regulator output voltage supplying a key component on the receivers (Volts) 0x06 = 3.3V Supply Voltage (Volts)	All except OEM7720 OEM7720
	0x07 = Antenna Voltage	All except OEM7500
	0x08 = Digital 1V2 Core Voltage Internal regulator output voltage supplying a key component on the receiver (Volts)	All
	0x0F = Regulated Supply Voltage Internal regulator output voltage supplying a key component on the receiver (Volts) 0x0F = Supply Voltage Voltage applied to Pins 1 and 2 of the main connector	All except OEM7720 OEM7720
	0x11 = 1V8	All
	0x16 = Secondary Temperature A second temperature sensor is located on the receiver PCB (degrees Celsius)	All except OEM7500

Bits	Description	Applicable Platforms
	0x17 = Peripheral Core Voltage	All except OEM7500
	0x18 = Secondary Antenna Current	OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2, SPAN CPT7
	0x19 = Secondary Antenna Voltage	OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2, SPAN CPT7

## 3.77 IONUTC

### *Ionospheric and UTC data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the Ionospheric Model parameters (ION) and the Universal Time Coordinated parameters (UTC).

**Message ID:** 8

**Log Type:** Asynch

**Recommended Input:**

```
log ionutca onchanged
```

**ASCII Example:**

```
#IONUTCA, COM1, 0, 58.5, FINESTEERING, 1337, 397740.107, 02000000, ec21, 1984;
1.210719347000122e-08, 2.235174179077148e-08, -5.960464477539062e-08,
-1.192092895507812e-07, 1.003520000000000e+05, 1.146880000000000e+05,
-6.553600000000000e+04, -3.276800000000000e+05, 1337, 589824,
-1.2107193470001221e-08, -3.907985047e-14, 1355, 7, 13, 14, 0*c1dfd456
```

The Receiver-Independent Exchange (RINEX<sup>1</sup>) format is a broadly accepted, receiver independent format for storing GPS data. It features a non-proprietary ASCII file format that can be used to combine or process data generated by receivers made by different manufacturers.

Use the NovAtel's Convert utility to produce RINEX files from NovAtel receiver data files.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	IONUTC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	a0	Alpha parameter constant term	Double	8	H
3	a1	Alpha parameter 1st order term	Double	8	H+8
4	a2	Alpha parameter 2nd order term	Double	8	H+16
5	a3	Alpha parameter 3rd order term	Double	8	H+24
6	b0	Beta parameter constant term	Double	8	H+32
7	b1	Beta parameter 1st order term	Double	8	H+40
8	b2	Beta parameter 2nd order term	Double	8	H+48
9	b3	Beta parameter 3rd order term	Double	8	H+56

<sup>1</sup>Refer to the U.S. National Geodetic Survey website at: [www.ngs.noaa.gov/CORS/data.shtml](http://www.ngs.noaa.gov/CORS/data.shtml).

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	utc wn	UTC reference week number	Ulong	4	H+64
11	tot	Reference time of UTC parameters (s)	Ulong	4	H+68
12	A0	UTC constant term of polynomial (s)	Double	8	H+72
13	A1	UTC 1st order term of polynomial (s)	Double	8	H+80
14	wn lsf	Future week number	Ulong	4	H+88
15	dn	Day number (the range is 1 to 7 where Sunday = 1 and Saturday = 7)	Ulong	4	H+92
16	deltat ls	Delta time due to leap seconds	Long	4	H+96
17	deltat lsf	Future delta time due to leap seconds	Long	4	H+100
18	Reserved			4	H+104
19	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+108
20	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.78 IPSTATS

### *IP statistics*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This log contains the current IP interface statistics.

**Message ID:** 1669

**Log Type:** Polled

**Recommended Input:**

```
log ipstatsa
```

**ASCII Example:**

```
#IPSTATSA,COM1,0,70.5,FINESTEERING,1749,328376.337,02000020,0d94,45068;1,CELL,0,526,526*01c4847c
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	IPSTATS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#Interface	Number of records to follow.	Ulong	4	H
3	Physical Interface	IP Interface Type 1 = ALL 2 = ETHA	Enum	4	H+4
4	Reserved		Ulong	4	H+8
5	Receive Bytes	Total number of bytes received	Ulong	4	H+12
6	Transmit Bytes	Total number of bytes transmitted	Ulong	4	H+16
7	Next reading offset = H+4+(#Interface * 16)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+(#Interface * 16)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.79 IPSTATUS

### *Current network configuration status*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-I, SMART7-SI

This log provides the configuration of IP address, netmask, gateway and a list of DNS servers currently in use.

**Message ID:** 1289

**Log Type:** Polled

**Recommended Input:**

```
log ipstatusa once
```

**ASCII Example:**

```
#IPSTATUSA,COM1,0,90.5,FINESTEERING,1609,500464.121,02000000,7fe2,6259;1,ETHA,"
10.4.44.131","255.255.255.0","10.4.44.1",1,"198.161.72.85"*ec22236c
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	IPSTATUS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#IPrec	Number of records to follow	Ulong	4	H
3	interface	Name of the network interface 2 = ETHA	Enum	4	H+4
4	IP address	IP Address-decimal dot notation	String [16]	variable <sup>1</sup>	H+8
5	netmask	Netmask-decimal dot notation	String [16]	variable <sup>1</sup>	H+24
6	gateway	Gateway-decimal dot notation This is the default gateway that is currently in use by the receiver.	String [16]	variable <sup>1</sup>	H+40
7...	Next reading offset = H+4+(#IPrec * 52)				
8	#dnserver	Number of DNS Servers to follow	Ulong	4	H+4+ (#IPrec x 52)
9	server IP address	IP address-decimal dot notation	String [16]	variable <sup>1</sup>	H+4+ (#IPrec x 52)+4

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
10...	Next reading offset = $H+4+(\#IPrec * 52)+4+(\#dnserver * 16)$				
11	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	$H+4+(\#IPrec * 52)+4+(\#dnserver * 16)$
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.80 ITBANDPASSBANK

### *Allowable band pass filter configurations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The ITBANDPASSBANK log provides information on the allowable configurations for each frequency when applying a bandpass filter. The current filters in use can be seen with the **ITFILTABLE** log on page 574.

To view the allowable configurations for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log **ITBANDPASSBANK\_1**.

**Message ID:** 2022

**Log Type:** Asynch

**Recommended Input:**

```
log itbandpassbanka once
```

**Abbreviated ASCII Example:**

```
<ITBANDPASSBANK USB1 0 87.5 FINESTEERING 1933 346809.694 12000020 fb2e 14137

6	min upper frequency cutoff	The minimum frequency cutoff at the upper end (MHz)	Float	4	H+16
7	max upper frequency cutoff	The maximum frequency cutoff at the upper end (MHz)	Float	4	H+20

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	frequency step	The minimum cut off frequency resolution (MHz)	Float	4	H+24
9	Next entry offset = $H + 4 + (\#entries * 24)$				
10	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#entries * 24)
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.81 ITDETECTSTATUS

### *Interference detection status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists all of the detected interferences from all active paths where interference detection is enabled.

This log should be used with the **onchanged** trigger only.

To view the detected interferences from all active paths on the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log **ITDETECTSTATUS\_1**.

**Message ID:** 2065

**Log Type:** Asynch

**Recommended Input:**

```
log itdetectstatusa onchanged
```

#### ASCII Example

```

## 3.82 ITFILTTABLE

### *Filter configuration for each frequency*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The ITFILTTABLE log contains the filter configuration summary for each frequency. It lists which bandpass or notch filters are enabled and how each is configured.

To view the filter configuration summary for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log `ITFILTTABLE_1`.

**Message ID:** 1991

**Log Type:** Asynch

**Recommended Input:**

```
log itfilttablea once
```

**ASCII Example:**

## 3.83 ITPROGFILTBANK

### *Allowable filter configurations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The ITPROGFILTBANK log provides information on the allowable configurations for the programmable filter for each frequency when applying either a notch filter or bandpass filter. The current filters in use can be seen with the ITFILTABLE log on page 574.

To view the allowable configurations for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log **ITPROGFILTBANK\_1**.

**Message ID:** 2023

## 3.84 ITPSDDETECT

### *Power spectral density computed by the interference detection algorithm*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The **ITPSDDETECT** log contains the power spectral density samples for the interference detection algorithm for all available RF paths, excluding the LBand path. The log will iterate through all available RF paths. It collects raw samples from Predecimation data source (as per the **ITPSDFINAL** log on page 583) every 500 ms. For dual antenna receivers, only the RF paths from the primary antenna are considered. Note that one log is output for every 1024 expected samples for a maximum of 32 logs and can be grouped together through the sequence number in the log header.

To view the power spectral density samples for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log **ITPSDDETECT\_1**.

### 3.84.1 PSD Samples

PSD samples are compressed into 2 byte samples to reduce log sizes. The range of values that can be displayed is -200 dBm to +56 dBm with a 1/256 resolution. The following steps should be performed on the PSD samples in this log to convert them back into dBm units for display purposes:

1. Divide the sample by 256.0
2. Subtract 200

**Message ID:** 2063

**Log Type:** Asynch

**Recommended Input:**

```
log itpsddetect onnew
```

#### ASCII Example

```

## 3.85 ITPSDFINAL

### *Processed power spectral density*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The ITPSDFINAL log contains the samples for the spectral analysis. The rate and size is set by the update period and the FFT size respectively when issuing the **ITSPECTRALANALYSIS** command (see page 206).

PSD samples are compressed into 2 byte samples to reduce log sizes. The range of values that can be displayed is -200 dBm to +56 dBm with a 1/256 resolution. The following steps should be performed on the PSD samples in this log to convert them back into dBm units for display purposes:

1. Divide the sample by 256.0
2. Subtract 200

The number of samples are calculated according to the following table. The maximum number of samples in one ITPSDFINAL log is 1024. That means if the number of samples is less than 1024, one log is enough to output them. However, if the number of samples is larger than 1024, more than one ITPSDFINAL log is needed. For example, in postdecimation mode with the FFT size of 8K and subcarrier integration of 5, there is one log with 1024 samples and another log with 614 samples. The output logs can be grouped together through the sequence number of the log header.

Data Source	Number of Samples
PREDECIMATION	$\text{FFTsize}/(2*\text{subcarrier\_integration})$
POSTDECIMATION	$\text{FFTsize}/\text{subcarrier\_integration}$
POSTFILTER	$\text{FFTsize}/\text{subcarrier\_integration}$

As the data rate for the ITPSDFINAL log is dictated by the updateperiod parameter in the **ITSPECTRALANALYSIS** command (see page 206), do not use ONTIME to log this message. Instead use ONNEW to log ITPSDFINAL.

The pre-decimation spectrum shows the absolute power in dBm which is proportional to the resolution bandwidth (RBW). The post-decimation and post-filter spectrum shows the signal magnitude in relative power (dB).

To view the samples for the spectral analysis for the secondary antenna of dual antenna receivers (OEM7720, PwrPak7D, PwrPak7D-E1, PwrPak7D-E2 and SPAN CPT7), log **ITPSDFINAL\_1**.

**Message ID:** 1968

**Log Type:** Asynch

**Recommended Input:**

```
log itpsdfinala onnew
```

**ASCII Example**

## 3.86 J1939STATUS

### Status of CAN J1939 Node

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This logs reports the status of J1939 node, specifically J1939 Address Claim function (initiated using the **J1939CONFIG** command (see page 211)).

This log displays the status only for nodes that have been set.

**Message ID:** 1907

**Log Type:** Asynch

**Recommended Input:**

```
LOG J1939STATUSA ONCHANGED
```

**ASCII Examples:**

```
#J1939STATUSA,COM1,1,81.0,UNKNOWN,0,0.000,02004020,e9ce,32768;NODE1,DISABLED,0,FE*637c7f
```

```
#J1939STATUSA,COM1,0,81.0,UNKNOWN,0,0.000,02004020,e9ce,32768;NODE2,DISABLED,0,FE*c41af5ee
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	J1939STATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	node	J1939 Node. The node can be either NODE1 or NODE2.	Enum	4	H
3	status	Node status. See <i>Table 126: Node Status</i> below	Enum	4	H+4
4	count	Number of attempts that were made to claim address. This will be 1 when the preferred address is used and may be more if the alternate range is used.	Ulong	4	H+8
5	address	Claimed CAN Address. 0xFE (NULL address) if the address could not be negotiated.	Uchar	1	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+13
7	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

**Table 126: Node Status**

Value	ASCII	Description
1	DISABLED	Address claim activity is not taking place. The node does not have J1939 enabled.

<b>Value</b>	<b>ASCII</b>	<b>Description</b>
2	CLAIMING	Address claim procedure is in progress.
3	CLAIMED	Address claimed successfully. Ready for data transfer.
4	FAILED	Address claim was not successful. No further activity is taking place.

## 3.87 LBANDBEAMTABLE

### List of L-Band beams

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists the TerraStar and Veripos L-Band beams known to the receiver.

**Message ID:** 1718

**Log Type:** Asynch

**Recommended Input:**

```
log lbandbeamtablea onchanged
```

**Abbreviated ASCII Example:**

```
<LBANDBEAMTABLE COM1 0 69.0 UNKNOWN 0 1.283 02044008 19b8 32768
< 8
< "AORE" "A" 1545855000 1200 -15.50 1
< "AORW" "B" 1545845000 1200 -54.00 1
< "IOR" "C" 1545865000 1200 64.50 1
< "POR" "D" 1545905000 1200 178.00 1
< "25E" "E" 1545825000 1200 25.00 1
< "143.5E" "F" 1545835000 1200 143.50 1
< "98W" "G" 1545865000 1200 -98.00 1
< "SP98W1" "SP98W1" 1545885000 1200 -98.00 1
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	LBANDBEAMTABLE header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	Name	Beam/transmitting satellite name	Char[8]	8	H+4
4	Reserved		Char[8]	8	H+12
5	Frequency	Frequency (Hz)	Ulong	4	H+20
6	Baud	Baud rate (bps)	Ulong	4	H+24
7	Longitude	Transmitting satellite longitude (degrees)	Float	4	H+28
8	Access	Beam service availability flag 0 = Denied 1 = Granted	Ulong	4	H+32
9	Next beam offset = H + 4 + (#entries * 32)				

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#entries * 32)
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.88 LBANDTRACKSTAT

### *L-Band Beams status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the L-Band tracking and Viterbi decoding status for the tracked L-Band beams.

The maximum logging rate for LBANDTRACKSTAT is 2 Hz.

**Message ID:** 1201

**Log Type:** Synch

**Recommended Input:**

```
log lbandtrackstata ontime 1
```

**ASCII Example:**

```
#LBANDTRACKSTATA, COM2, 0, 82.5, FINESTEERING, 2054, 406100.000, 02004000, 29e3, 15526;

```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	LBANDTRACKSTAT header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	Name	Beam/transmitting satellite name	Char[8]	8	H+4
4	Frequency	Frequency assigned to this L-Band beam (Hz)	Ulong	4	H+12
5	Baud rate	Baud rate of assigned beam	Ushort	2	H+16
6	ID	Service ID of the assigned beam	Ushort	2	H+18
7	Status	Tracking status word. See <i>Table 127: L-Band Signal Tracking Status</i> on the next page	Ushort	2	H+20
8	Reserved	Reserved	Ushort	2	H+22
9	Doppler	Signal Doppler (Hz)	Float	4	H+24
10	C/No	Carrier to noise density ratio (dB-Hz)	Float	4	H+28

Field	Field type	Description	Format	Binary Bytes	Binary Offset
11	Phase std. dev.	Phase error standard deviation (cycles)	Float	4	H+32
12	Lock time	Lock time (s)	Float	4	H+36
13	Unique word bits	Total unique word bits	Ulong	4	H+40
14	Bad unique word bits	Bad unique word bits	Ulong	4	H+44
15	Bad unique words	Bad unique words	Ulong	4	H+48
16	Viterbi symbols	Total Viterbi symbols	Ulong	4	H+52
17	Corrected Viterbi	Corrected Viterbi symbols	Ulong	4	H+56
18	Bit error rate	Estimated pre-Viterbi Bit Error Rate (BER)	Float	4	H+60
19	Next entry offset = H + 4 + (#entries x 60)				
20	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+ (#entries x 60)
21	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 127: L-Band Signal Tracking Status

Nibble	Bit	Mask	Description	Range Value
N0	0	0x0001	Tracking State	0 = Searching, 1 = Pull-in, 2 = Tracking, 3 = Idle
	1	0x0002

## 3.89 LOGLIST

### *List of system logs*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists which messages are currently being logged to each port and when. The following tables show the binary and ASCII output. See also the **RXCONFIG** log on page 775 for a list of current command settings.

**Message ID:** 5

**Log Type:** Polled

**Recommended Input:**

```
log loglista once
```

**ASCII Example:**

```
#LOGLISTA,COM1,0,60.5,FINESTEERING,1337,398279.996,02000000,c00c,1984; 8,
COM1,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
COM2,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
COM3,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
USB1,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
USB2,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
USB3,RXSTATUSEVENTA,ONNEW,0.000000,0.000000,HOLD,
COM1,BESTPOSA,ONTIME,10.000000,0.000000,NOHOLD,
COM1,LOGLISTA,ONCE,0.000000,0.000000,NOHOLD*5b29eed3
```

Do not use undocumented logs or commands. Doing so may produce errors and void your warranty.

### 3.89.1 Binary

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	LOGLIST (binary) header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#logs	Number of messages to follow, maximum = 80	Ulong	4	H
3	port	Output port, see <i>Table 4: Detailed Port Identifier</i> on page 36	Enum	4	H+4
4	message	Message ID of the log	Ushort	2	H+8

Field	Field type	Description	Format	Binary Bytes	Binary Offset
5	message type	Bits 0-4 = Reserved Bits 5-6 = Format 00 = Binary 01 = ASCII 10 = Abbreviated ASCII, NMEA 11 = Reserved Bit 7 = Response Bit (see <i>Message Responses</i> on page 45) 0 = Original Message 1 = Response Message	Char	1	H+10
6	Reserved		Char	1	H+11
7	trigger	0 = ONNEW 1 = ONCHANGED 2 = ONTIME 3 = ONNEXT 4 = ONCE 5 = ONMARK	Enum	4	H+12
8	period	Log period for ONTIME	Double	8	H+16
9	offset	Offset for period (ONTIME trigger)	Double	8	H+24
10	hold	0 = NOHOLD 1 = HOLD	Enum	4	H+32
11...	Next log offset = H + 4 + (#logs x 32)				
variable	xxxx	32-bit CRC	Hex	4	H+4+ (#logs x 32)

### 3.89.2 ASCII

Field	Field type	Description	Format
1	LOGLIST (ASCII) header	Log header. See <i>Messages</i> on page 30 for more information.	
2	#port	Number of messages to follow, maximum = 80	Long
3	port	Output port, see <i>Table 4: Detailed Port Identifier</i> on page 36	Enum
4	message	Message name of log with no suffix for abbreviated ASCII, an A suffix for ASCII and a B suffix for binary	Char []

Field	Field type	Description	Format
5	trigger	ONNEW ONCHANGED ONTIME ONNEXT ONCE ONMARK	Enum
6	period	Log period for ONTIME	Double
7	offset	Offset for period (ONTIME trigger)	Double
8	hold	NOHOLD HOLD	Enum
9...	Next port		
variable	xxxx	32-bit CRC	Hex
variable	[CR][LF]	Sentence terminator	-

## 3.90 LUAFILELIST

### List available Lua scripts

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This sequenced log informs the user of the available scripts, obtained from the ISO loaded onto the receiver. The size of the file, last change date in `yyyymmdd` format, last change time in `hhmmss` format, and path to the files are printed as well.

**Message ID:** 2151

**Log Type:** Polled

**Recommended Input:**

```
LOG LUAFILELIST
```

**Abbreviated ASCII Example:**

```
[COM1]<LUAFILELIST COM1 6 89.5 UNKNOWN 0 4.000 02444020 b447 14635
< 0 20180202 151403 "/lua/uppercase.lua"
<LUAFILELIST COM1 5 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 2706 20180129 152042 "/lua/debugloop.lua"
<LUAFILELIST COM1 4 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 4692 20180202 110107 "/lua/parsetime.lua"
<LUAFILELIST COM1 3 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 4764 20180205 105415 "/lua/scom_rx.lua"
<LUAFILELIST COM1 2 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 3728 20180202 104830 "/lua/scomtunnel.lua"
<LUAFILELIST COM1 1 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 3044 20180201 144849 "/lua/scriptargs.lua"
<LUAFILELIST COM1 0 90.5 UNKNOWN 0 4.000 02444020 b447 14635
< 2337 20180129 155140 "/lua/sendtocom2.lua"
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	LUAFILELIST header	Log header. See Messages for more information.	-	H	0
2	Size	File size (in Bytes)	Ulong	4	H
3	Date	Last change date When viewed as a string, the date is of the form YYYYMMDD. So, numerically, the date is (Year * 10000) + (Month * 100) + (Day).	Ulong	4	H+4
4	Time	Last change time When viewed as a string, the time is HHMMSS. So, numerically, the time is (Hour * 10000) + (Minute * 100) + (Second).	Ulong	4	H+8
5	Path	The path to the Lua script The maximum length of this string is 256 bytes.	String	Variable	H+12

## 3.91 LUAFILESYSTEMSTATUS

### Query mount status of Lua scripts

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this log to query the mount status of the ISO image that contains the Lua scripts loaded on to the receiver.

**Message ID:** 2150

**Log Type:** Asynch

**Recommended Input:**

```
LOG LUAFILESYSTEMSTATUS
```

**Abbreviated ASCII Example:**

```
<LUAFILESYSTEMSTATUS COM1 0 90.0 UNKNOWN 0 0.204 02444020 b8f8 14635
< MOUNTED ""
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	LUAFILESYSTEMSTATUS header	Log header. See Messages for more information.		H	0
2	Status	The status of the file system. See <i>Table 128: File System Status</i> below.	Enum	4	H
3	Error	String that indicates the error message if mounting fails The maximum length of this string is 52 bytes.	String	Variable	H+4

**Table 128: File System Status**

Value	Description
1	UNMOUNTED
2	MOUNTED
3	BUSY
4	ERROR
5	UNMOUNTING
6	MOUNTING

## 3.92 LUAOUTPUT

### *Output stderr and stdout from the Lua interpreter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this log to output `stderr` and `stdout` messages from the Lua interpreter.

**Message ID:** 2240

**Log Type:** Asynch

**Recommended Input:**

```
LOG LUAOUTPUT ONNEW
```

**Abbreviated ASCII Example:**

```
<LUAOUTPUT 0 346044.929
<    1 0 STDOUT "Lua 5.3.4 Copyright (C) 1994-2017 Lua.org, PUC-Rio"
<LUAOUTPUT 0 346044.987
<    2 0 STDOUT "> "
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	LUAOUTPUT header	Log header. See Messages for more information.	-	H	0
2	Sequence Number	Running number of each LUAOUTPUT log produced by the system	Ulong	4	H
3	Executor Number	Lua Executor Number that produced the data	Ulong	4	H+4
4	Data Source	See <i>Table 129: Lua Data Source</i> below	Enum	4	H+8
5	Data	NULL-terminated string containing a single line of data from <code>stderr</code> or <code>stdout</code> . This string is not terminated with a carriage return or line feed.  This string contains only printable characters.  The maximum length of this string is 128 bytes.	String	Variable	H+12

**Table 129: Lua Data Source**

Binary	ASCII	Description
0	STDOUT	Data is from <code>stdout</code>
1	STDERR	Data is from <code>stderr</code>

### 3.93 LUASTATUS

#### *Display status of Lua scripts*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

Use this log to determine which scripts are running on the receiver and whether the scripts have exited or encountered errors.

**Message ID:** 2181

**Log Type:** Collection

**Recommended Input:**

LOG LUASTATUS

**Abbreviated ASCII Example:**

```
[COM1]<LUASTATUS COM1 1 84.5 FINESTEERING 1963 402110.866 02400000 2e18 32768
< 0 "icom_rx.lua 127.0.0.1 3001" EXECUTING
<LUASTATUS COM1 0 84.5 FINESTEERING 1963 402110.866 02400000 2e18 32768
< 1 "" NOT_STARTED
```

The example above is for the projected log output for two executors.

Field	Field Type	Description	Format	Binary Bytes	Binary Format
1	LUASTATUS header	Log header. See Messages for more information.		H	0
2	Number	Executor number	Ulong	4	H
3	Script	Script and arguments	String [256]	Variable	H+4
4	Status	Script status. See <i>Table 130: Script Status</i> below.	Enum	4	Variable

**Table 130: Script Status**

Binary	ASCII	Description
0	NOT_STARTED	There is no script running on the executor
1	EXECUTING	The script is running
2	COMPLETED	The script completed successfully
3	SCRIPT_ERROR	The script exited with an error
4	EXECUTOR_ERROR	The script executor encountered an error while attempting to run the script

## 3.94 MARKPOS, MARK2POS, MARK3POS and MARK4POS

### *Position at time of mark input event*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART2

This log contains the estimated position of the antenna when a pulse is detected at a mark input.

- MARKPOS is generated when a pulse occurs on the MK1I (EVENT\_IN1) input.
- MARK2POS is generated when a pulse occurs on the MK2I (EVENT\_IN2) input.
- MARK3POS is generated when a pulse occurs on the MK3I (EVENT\_IN3) input (OEM7600, OEM7700 and OEM7720 only).
- MARK4POS is generated when a pulse occurs on the MK4I (EVENT\_IN4) input (OEM7600, OEM7700 and OEM7720 only).

Refer to the *Technical Specifications* appendices in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for mark input pulse specifications and the location of the mark input pins.

The position at the mark input pulse is extrapolated using the last valid position and velocities. The latched time of mark impulse is in GPS reference weeks and seconds into the week. The resolution of the latched time is 10 ns. See also the notes on MARKPOS in the **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log on page 603.

The position for the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** logs are reported in the user selected datum. See the **DATUM** command on page 119 for more details.

**Message ID:** 181 (MARKPOS)  
615 (MARK2POS)  
1738 (MARK3POS)  
1739 (MARK4POS)

**Log Type:** Asynch

**Recommended Input:**

```
log markposa onnew
```

1. Use the ONNEW trigger with the MARKxTIME or MARKxPOS logs.
2. ONMARK only applies to MK1I. Events on MK2I (if available) do not trigger logs when ONMARK is used. Use the ONNEW trigger with the MARK1TIME, MARK2TIME, MARKPOS or MARK2POS logs.
3. Once the 1PPS signal has hit a rising edge, for both MARKxPOS and MARKxTIME logs, a resolution of both measurements is 10 ns. As for the ONMARK trigger for other logs that measure latency, for example RANGE and POSITION logs such as BESTPOS, it takes typically 20-30 ms (50 ms maximum) for the logs to output information from the 1PPS signal. Latency is the time between the reception of the 1PPS pulse and the first byte of the associated log. See also the **MARK1TIME**, **MARK2TIME**, **MARK3TIME** and **MARK4TIME** log on page 603.

**Abbreviated ASCII Example:**

```
<MARKPOS COM1 0 89.0 FINESTEERING 1670 413138.000 02000020 c223 42770
SOL_COMPUTED SINGLE 51.11289233689 -114.02932170726 1018.9653 1049.4915 BUKIT
1.9372 1.1981 4.0909 "" 0.000 0.000 19 18 18 18 0 06 0 33
```

Consider the case where you have a user point device such as video equipment. Connect the device to the receiver's I/O port using a cable that is compatible to both the receiver and the device. Refer to your device's documentation for information about connectors and cables. The arrow along the cable in the figure below indicates a MARKIN pulse, from the user device on the right to the receiver I/O port.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	MARKPOS/ MARK2POS/ MARK3POS/ MARK4POS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status (see <i>Table 80: Solution Status</i> on page 432)	Enum	4	H
3	pos type	Position type (see <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+4

## 3.95 MARK1TIME, MARK2TIME, MARK3TIME and MARK4TIME

### *Time of mark input event*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART2

This log contains the time of the leading edge of the detected mark input pulse.

- MARK1TIME is generated when a pulse occurs on a MK1I (EVENT\_IN1) input
- MARK2TIME is generated when a pulse occurs on a MK2I (EVENT\_IN2) input
- MARK3TIME is generated when a pulse occurs on a MK3I (EVENT\_IN3) input (OEM7600, OEM7700 and OEM7720 only)
- MARK4TIME is generated when a pulse occurs on a MK4I (EVENT\_IN4) input (OEM7600, OEM7700 and OEM7720 only)

The MARKTIME log (message ID 231) is deprecated. Use the MARK1TIME log as a replacement.

Refer to the *Technical Specifications* appendix in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for mark input pulse specifications and the location of the mark input pins. The resolution of this measurement is 10 ns.

1. Use the ONNEW trigger with the MARKxTIME or the MARKxPOS logs.
2. Only the MARKxPOS logs, MARKxTIME logs and 'polled' log types are generated 'on the fly' at the exact time of the mark. Synchronous and asynchronous logs output the most recently available data.
3. ONMARK only applies to MK1I. Events on MK2I (if available) do not trigger logs when ONMARK is used. Use the ONNEW trigger with the MARK1TIME, MARK2TIME, MARKPOS or MARK2POS logs.
4. Once the 1PPS signal has hit a rising edge, for both MARKxPOS and MARKxTIME logs, a resolution of both measurements is 10 ns. As for the ONMARK trigger for other logs that measure latency, for example RANGE and POSITION logs such as BESTPOS, it takes typically 20-30 ms (50 ms maximum) for the logs to output information from the 1PPS signal. Latency is the time between the reception of the 1PPS pulse and the first byte of the associated log. See also the **MARKPOS**, **MARK2POS**, **MARK3POS** and **MARK4POS** log on page 600.

**Message ID:**  
 1130 (MARK1TIME)  
 616 (MARK2TIME)  
 1075 (MARK3TIME)  
 1076 (MARK4TIME)

**Log Type:** Asynch

**Recommended Input:**

```
log mark1timea onnew
```

**ASCII Example:**

```
#MARK1TIMEA,COM1,0,77.5,FINESTEERING,1358,422621.000,02000000,292e,2214;1358,42  
2621.000000500,-1.398163614e-08,7.812745577e-08,-14.000000002,VALID*d8502226
```

These logs allow you to measure the time when events are occurring in other devices (such as a video recorder). See also the **MARKCONTROL** command on page 227.

GPS reference time is the receiver's estimate of the true GPS system time. GPS reference time can be found in the header of the log. The relationship between GPS reference time and true GPS system time is:

GPS system time = GPS reference time - offset

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	MARK1TIME/ MARK2TIME/ MARK3TIME/ MARK4TIME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	week	GPS reference week number	Long	4	H
3	seconds	Seconds into the week as measured from the receiver clock, coincident with the time of electrical closure on the Mark Input port	Double	8	H+4
4	offset	Receiver clock offset, in seconds. A positive offset implies that the receiver clock is ahead of GPS system time. To derive GPS system time, use the following formula:  GPS system time = GPS reference time - (offset)  Where GPS reference time can be obtained from the log header	Double	8	H+12
5	offset std	Standard deviation of receiver clock offset (s)	Double	8	H+20
6	utc offset	This field represents the offset of GPS system time from UTC time (s), computed using almanac parameters. UTC time is GPS reference time plus the current UTC offset minus the receiver clock offset.  UTC time = GPS reference time - offset + UTC offset   0 indicates that UTC time is unknown because there is no almanac available in order to acquire the UTC offset.	Double	8	H+28
7	status	Clock model status, see <i>Table 95: Clock Model Status</i> on page 457	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.96 MASTERPOS

### *Master Position using ALIGN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

ALIGN generates distance and bearing information between a Master and Rover receiver. This log outputs the position information of the master when using the ALIGN feature. This log can be output from both Y and Z ALIGN models and can be output at both Master and Rover ends.

You must have an ALIGN capable receiver to use this log.

1. ALIGN is useful for obtaining the relative directional heading of a vessel/body, separation heading between two vessels/bodies or heading information with moving base and pointing applications.
2. The log can be output at both Y and Z model Rover if it is receiving the RTCAREFEXT or NovAtelXRef message from the Master. The log can be output at any Master if the Master is receiving HEADINGEXTB or HEADINGEXT2B from the Rover. Refer to the NovAtel application note [APN-048: ALIGN Family of Heading Solutions](http://novatel.com/support/support-materials/application-notes) for details on HEADINGEXT (available on our website at [novatel.com/support/support-materials/application-notes](http://novatel.com/support/support-materials/application-notes)).
3. MASTERPOS logging is dictated by the output frequency of the RTCAREFEXT or NovAtelXRef output frequency.

**Message ID:** 1051

**Log Type:** Asynch

**Recommended Input:**

```
log masterposa onchanged
```

**ASCII Example:**

```
#MASTERPOSA,COM1,0,21.5,FINESTEERING,1544,340322.000,02000008,5009,4655;
SOL_COMPUTED,NARROW_INT,51.11604599076,-114.03855412002,1055.7756,16.9000,
WGS84,0.0090,0.0086,0.0143,"AAAA",0.0,0.0,13,13,13,12,0,0,0,0*a72e8d3f
```

Asynchronous logs, such as MASTERPOS, should only be logged ONCHANGED or ONNEW otherwise, the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

## 3.97 MATCHEDPOS

### *Matched RTK position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log represents positions that have been computed from time matched base and rover observations. There is no base extrapolation error on these positions because they are based on buffered measurements, that is, they lag real time by some amount depending on the latency of the data link. If the rover receiver has not been enabled to accept RTK differential data or is not actually receiving data leading to a valid solution, this is shown in fields #2 (*sol status*) and #3 (*pos type*).

This log provides the best accuracy in static operation. For lower latency in kinematic operation, see the **RTKPOS** log (see page 765) or **BESTPOS** log (see page 429). The data in the logs changes only when a base observation (RTCMv3) changes.

A good message trigger for this log is `onchanged`. Then, only positions related to unique base station messages are produced and the existence of this log indicates a successful link to the base.

Asynchronous logs, such as MATCHEDPOS, should only be logged `ONCHANGED` otherwise the most current data is not output when it is available. This is especially true of the `ONTIME` trigger, which may cause inaccurate time tags to result.

The RTK system in the receiver provides two kinds of position solutions. The Matched RTK position is computed with buffered observations, so there is no error due to the extrapolation of base station measurements. This provides the highest accuracy solution possible at the expense of some latency which is affected primarily by the speed of the differential data link. The **MATCHEDPOS** log contains the matched RTK solution and can be generated for each processed set of base station observations.

The Low-Latency RTK position is computed from the latest local observations and extrapolated base station observations. This supplies a valid RTK position with the lowest latency possible at the expense of some accuracy. The degradation in accuracy is reflected in the standard deviation and is summarized in *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss). The amount of time that the base station observations are extrapolated is in the "differential age" field of the position log. The Low-Latency RTK system extrapolates for 60 seconds. The **RTKPOS** log (see page 765) contains the Low-Latency RTK position when valid, and an "invalid" status when a Low-Latency RTK solution could not be computed. The **BESTPOS** log (see page 429) contains either the low-latency RTK, PPP or pseudorange-based position, whichever has the smallest standard deviation.

**Message ID:** 96

**Log Type:** Asynch

**Recommended Input:**

```
log matchedposa onchanged
```

**ASCII Example:**

```
#MATCHEDPOSA, COM1, 0, 63.0, FINESTEERING, 1419, 340034.000, 02000040, 2f06, 2724;
SOL_COMPUTED, NARROW_INT, 51.11635908660, -114.03833102484, 1063.8400, -16.2712,
WGS84, 0.0140, 0.0075, 0.0174, "AAAA", 0.000, 0.000, 12, 12, 12, 12, 0, 01, 0, 33*feac3a3a
```

Measurement precision is different from the position computation precision. Measurement precision is a value that shows how accurately the actual code or carrier phase is measured by the GNSS receiver. Position precision is a value that shows the accuracy of the position computation made from the code and/or carrier phase measurements. The P-code L2 measurement precision is not as good as the C/A measurement precision because the NovAtel GNSS receiver is a civilian grade GPS device and does not have direct access to the decrypted military L2 P(Y) code. This means that NovAtel's semi-codeless P-code L2 measurements are noisier than the civilian band C/A code measurements. Refer to the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#) for the technical specification of the OEM7 card.

Field	Field type	Description	Format	Binary Bytes	Binary Offset

## 3.99 MATCHEDXYZ

### *Matched RTK Cartesian position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the receiver's matched position in ECEF coordinates. It represents positions that have been computed from time matched base and rover observations. There is no base station extrapolation error on these positions because they are based on buffered measurements, that is, they lag real time, by some amount, depending on the latency of the data link. If the rover receiver has not been enabled to accept RTK differential data or is not actually receiving data leading to a valid solution, this is reflected by the code shown in field #2 (solution status) and #3 (position type). See *Figure 12: The WGS84 ECEF Coordinate System* on page 448 for a definition of the ECEF coordinates.

This log provides the best accuracy in static operation. For lower latency in kinematic operation, see the **BESTXYZ** log (see page 446) or **RTKXYZ** log (see page 772). The data in the logs changes only when a base observation (RTCMv3) changes.

The time stamp in the header is the time of the matched observations that the computed position is based on and not the current time.

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID:** 242

**Log Type:** Asynch

**Recommended Input:**

```
log matchedxyza onchanged
```

Asynchronous logs, such as MATCHEDXYZ, should only be logged ONCHANGED otherwise the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

**ASCII Example:**

```
#MATCHEDXYZA, COM1, 0, 62.5, FINESTEERING, 1419, 340035.000, 02000040, b8ed, 2724;

## 3.100 MODELFEATURES

### *States features available for current loaded model*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The MODELFEATURES log states the features available for the current loaded model.

To see which satellite systems are available for the current model, use the **CHANCONFIGLIST** log (see page 451).

Most features have a boolean state: authorized or unauthorized. However, some have more complex licensed states with varying degrees of capability.

This log is best viewed in Abbreviated ASCII.

**Message ID:** 1329

**Log Type:** Polled

**Recommended Input:**

```
log modelfeatures once
```

2	# Feature	Number of features in list	Ulong	4	H
3	Feature Status	Licensing status of feature See <i>Table 131: Feature Status</i> below	Enum	4	H+4
4	Feature Type	Type of feature See <i>Table 132: Feature Type</i> on the next page	Enum	4	H+8
5...	Next feature = H+4+(# Feature x 8)				
6	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+(# Feature x 8)
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 131: Feature Status

Value	Name	Description
0	AUTHORIZED	The feature is authorized
1	UNAUTHORIZED	The feature is unauthorized
2	0Hz	Disables output of POS logs
6	20Hz	Maximum logging rate for POS or MSR logs is 20 Hz
8	100Hz	Maximum logging rate for POS or MSR logs is 100 Hz
9	RATE_INVALID	Option bits don't correspond to a valid rate
15	STANDARD	SPAN Standard Model
20	COMMERCIAL_MEMS	IMU Grade-Commercial MEMS
21	TACTICAL	IMU Grade-Tactical
22	HIGH_GRADE_TACTICAL	IMU Grade-High Grade Tactical
23	NAVIGATION	IMU Grade-Navigation
25	SINGLE	Single antenna
26	DUAL	Dual antenna
30	LITE	SPAN Lite Model
33	CONSUMER_MEMS	IMU Grade-Consumer MEMS

Value	Name	Description
37	RADIO_TX	External Radio Control
38	GLIDE	GLIDE
39	TILT	Tilt

**Table 132: Feature Type**

Value	Name	Description
0	MAX_MSR_RATE	Maximum measurement logging rate
1	MAX_POS_RATE	Maximum position logging rate
3	MEAS_OUTPUT	Output of raw measurements (phase and pseudorange)
4	DGPS_TX	Transmission of DGPS (non RTK) corrections
5	RTK_TX	Transmission of RTK corrections
6	RTK_FLOAT	RTK float positioning
7	RTK_FIXED	RTK fixed positioning
8	RAIM	Extended RAIM
9	LOW_END_POSITIONING	GLIDE and TerraStar-L positioning
10	ALIGN_HEADING	Heading
11	ALIGN_RELATIVE_POS	Heading and Relative Positioning
12	API	Lua Scripted User Interface (formerly User Application API)
15	NTRIP	NTRIP Server/Client
19	PPP	TerraStar-C, TerraStar-C PRO, or TerraStar-X positioning
20	SCINTILLATION	Scintillation
22	INS	Inertial (SPAN)
23	IMU	IMU Grade
26	FEATURE_INTERFERENCE_MITIGATION	Interference Mitigation
28	ANTENNA	Number of antenna enabled on the receiver
29	GENERIC_IMU	SPAN Generic IMU Interface
30	INS_PLUS_PROFILES	SPAN Plus Profiles
31	HEAVE	SPAN Heave Option

---

Value	Name	Description
32	RELATIVE_INS	SPAN Relative INS
33	PRODUCT_FEATURE	Additional product feature has been authorized. See the <b>Feature Status</b> field for details.
34	SPRINKLER	Sprinkler
999	MODEL_INVALID	If a bad model is loaded, MODELFEATURES will contain one entry: MODEL_INVALID STATUS_INVALID

## 3.101 NAVICALMANAC

### *Decoded NavIC Almanac*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the decoded NavIC almanac parameters from NavIC navigation messages. Multiple messages are transmitted, one for each satellite ID with data.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

**Message ID:** 2122

**Log Type:** Asynch

**Recommended Input:**

```
log navicalmanaca onchanged
```

**ASCII Example:**

```
#NAVICALMANACA, COM1, 4, 69.5, SATTIME, 1943, 158160.000, 02000020, fb6e, 32768; 919,

```

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

### 3.103 NAVICIONO

#### *NavIC ionospheric coefficients parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains NavIC ionospheric coefficients parameters. Ionospheric error correction for single frequency (L5) users of the NavIC are provided through a set of eight coefficients. The correction coefficients are:

- 4 Alpha Coefficients ( $\alpha_n$ ;  $n=0,1,2,3$ )

These are the coefficients of the cubic polynomial representing the amplitude of the positive cosine curve in the cosine model approximation of ionospheric delay.

- 4 Beta Coefficients ( $\beta_n$ ;  $n=0,1,2,3$ )

These are the coefficients of the cubic polynomial representing the period of the positive cosine curve in the cosine model approximation of ionospheric delay.

**Message ID:** 2124

**Log Type:** Asynch

**Recommended Input:**

```
log navicionoa onchanged
```

**ASCII Example:**

```
#NAVICIONOA,COM1,0,92.5,SATTIME,1944,166272.000,02000020,56c0,32768;

## 3.104 NAVICRAWSUBFRAME

### *Raw NavIC subframe data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the raw NavIC subframe data with parity bits removed. Only subframes that have passed the parity check are output.

**Message ID:** 2105

**Log Type:** Asynch

**Recommended Input:**

```
log navicrawsubframea onchanged
```

**ASCII Example:**

```
#NAVICRAWSUBFRAMEA,COM1,0,72.5,SATTIME,1943,159168.000,02000020,76af,32768;182,

## 3.105 NAVICSYSCLOCK

### *NavIC clock parameters*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log provides the NavIC system time offset with respect to UTC, UTC (NPLI) and other GNSS times such as GPS, GALILEO, GLONASS.

**Message ID:** 2125

**Log Type:** Asynch

**Recommended Input:**

```
log navicsysclocka onchanged
```

**ASCII Example:**

```
#NAVICSYSCLOCKA,COM1,0,93.0,SATTIME,1944,166320.000,02000020,3dfd,32768;7,

## 3.106 NAVIGATE

### *User navigation data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log reports the status of the waypoint navigation progress. It is used in conjunction with the **SETNAV** command (see page 331).

See the figure below for an illustration of navigation parameters.

The **SETNAV** command (see page 331) must be enabled before valid data will be reported from this log.

**Figure 13: Navigation Parameters**

Reference	Description
1	TO lat-lon
2	X-Track perpendicular reference point
3	Current GPS position
4	A-Track perpendicular reference point
5	X-Track (cross track)
6	A-Track (along track)
7	Distance and bearing from 3 to 1

**Message ID:** 161

**Log Type:** Sync

**Recommended Input:**

```
log navigatea ontime 1
```

**ASCII Example:**

```
#NAVIGATEA, COM1, 0, 56.0, FINESTEERING, 1337, 399190.000, 02000000, aece, 1984;  
SOL_COMPUTED, PSRDIFF, SOL_COMPUTED, GOOD, 9453.6278, 303.066741, 133.7313,  
9577.9118, 1338, 349427.562*643cd4e2
```

Use the **NAVIGATE** log in conjunction with the **SETNAV** command (see page 331) to tell you where you currently are with relation to known To and From points. You can find a specific latitude, longitude or height knowing from where you started. For example, a backpacker could use these two commands to program a user supplied graphical display, on a digital GPS compass, to show their progress as they follow a defined route.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	NAVIGATE header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	pos type	Position type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	vel status	Velocity status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H+8
5	nav type	Navigation data type (see <i>Table 134: Navigation Data Type</i> on the next page)	Enum	4	H+12
6	distance	Straight line horizontal distance from current position to the destination waypoint, in meters (see <i>Figure 13: Navigation Parameters</i> on the previous page). This value is positive when approaching the waypoint and becomes negative on passing the waypoint.	Double	8	H+16
7	bearing	Direction from the current position to the destination waypoint, in degrees, with respect to True North (or magnetic if corrected for magnetic variation by the <b>MAGVAR</b> command on page 225).	Double	8	H+24
8	along track	Horizontal track distance from the current position to the closest point on the waypoint arrival perpendicular; expressed in meters. This value is positive when approaching the waypoint and becomes negative on passing the waypoint.	Double	8	H+32
9	xtrack	The horizontal distance (perpendicular track error), from the vessel's present position to the closest point on the great circle line, that joins the FROM and TO waypoints. If a "track offset" has been entered in the <b>SETNAV</b> command (see page 331), xtrack is the perpendicular error from the "offset track". Xtrack is expressed in meters. Positive values indicate the current position is right of the Track, while negative offset values indicate left.	Double	8	H+40
10	eta week	Estimated GPS reference week number at time of arrival at the "TO" waypoint, along track arrival perpendicular based on current position and speed, in units of GPS reference weeks. If the receiving antenna is moving at a speed of less than 0.1 m/s, in the direction of the destination, the value in this field is "9999".	Ulong	4	H+48

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
11	eta secs	Estimated GPS seconds into week at time of arrival at destination waypoint along track arrival perpendicular, based on current position and speed, in units of GPS seconds into the week. If the receiving antenna is moving at a speed of less than 0.1 m/s in the direction of the destination, the value in this field is "0.000".	Double	8	H+52
12	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+60
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 134: Navigation Data Type

Binary	ASCII	Description
0	GOOD	Navigation is good
1	NOVELOCITY	Navigation has no velocity
2	BADNAV	Navigation calculation failed for an unknown reason
3	FROM_TO_SAME	"From" is too close to "To" for computation
4	TOO_CLOSE_TO_TO	Position is too close to "To" for computation
5	ANTIPODAL_WAYPTS	Waypoints are antipodal on surface

### 3.107 NMEA Standard Logs

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains NMEA logs.

<b>GLMLA</b>	<b>GLONASS Almanac Data</b>
<b>GPALM</b>	<b>Almanac Data</b>
<b>GPGGA</b>	<b>Global Position System Fix Data and Undulation</b>
<b>GPGGALONG</b>	<b>GPS Fix Data, Extra Precision and Undulation</b>
<b>GPGLL</b>	<b>Geographic Position</b>
<b>GPGRS</b>	<b>GPS Range Residuals for Each Satellite</b>
<b>GPGSA</b>	<b>GPS DOP on Active Satellites</b>
<b>GPGST</b>	<b>Estimated Error in Position Solution</b>
<b>GPGSV</b>	<b>GPS Satellites in View</b>
<b>GPHDT</b>	<b>NMEA Heading Log (ALIGN)</b>
<b>GPRMB</b>	<b>Navigation Information</b>
<b>GPRMC</b>	<b>GPS Specific Information</b>
<b>GPVTG</b>	<b>Track Made Good and Ground Speed</b>
<b>GPZDA</b>	<b>UTC Time and Date</b>

The NMEA log structures follow format standards as adopted by the National Marine Electronics Association. The reference document used is "Standard For Interfacing Marine Electronic Devices NMEA 0183 Version 3.01". For further information, refer to [www.nmea.org](http://www.nmea.org). The following table contains excerpts from Table 6 of the NMEA Standard which defines the variables for the NMEA logs. The actual format for each parameter is indicated after the description.

See the Note in the **GPGGA** log (see page 517) that applies to all NMEA logs.

1. Spaces may only be used in variable text fields.
2. A negative sign "-" (HEX 2D) is the first character in a Field if the value is negative. The sign is omitted if the value is positive.
3. All data fields are delimited by a comma (,).
4. Null fields are indicated by no data between two commas (,). Null fields indicate invalid data or no data available.
5. The NMEA Standard requires that message length be limited to 82 characters.

Field Type	Symbol	Definition
<b>Special Format Fields</b>		

Field Type	Symbol	Definition
Status	A	Single character field: A = Yes, Data Valid, Warning Flag Clear V = No, Data Invalid, Warning Flag Set
Latitude	lll.ll	Fixed/Variable length field: degrees minutes.decimal - 2 fixed digits of degrees, 2 fixed digits of mins and a <i>variable</i> number of digits for decimal-fraction of minutes. Leading zeros always included for degrees and minutes to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required
Longitude	yyyyy.yy	Fixed/Variable length field: degrees minutes.decimal - 3 fixed digits of degrees, 2 fixed digits of minutes and a <i>variable</i> number of digits for decimal-fraction of minutes. Leading zeros always included for degrees and minutes to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required
Time	hhmmss.ss	Fixed/Variable length field: hours minutes seconds.decimal - 2 fixed digits of hours, 2 fixed digits of minutes, 2 fixed digits of seconds and <i>variable</i> number of digits for decimal-fraction of seconds. Leading zeros always included for hours, minutes and seconds to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required.
Defined field		Some fields are specified to contain predefined constants, most often alpha characters. Such a field is indicated in this standard by the presence of one or more valid characters. Excluded from the list of allowable characters are the following which are used to indicate field types within this standard:  "A", "a", "c", "hh", "hhmmss.ss", "lll.ll", "x", "yyyyy.yy"
<b>Numeric Value Fields</b>		
Variable numbers	x.x	Variable length integer or floating numeric field. Optional leading and trailing zeros. The decimal point and associated decimal-fraction are optional if full resolution is not required (example: 73.10 = 73.1 = 073.1 = 73)
Fixed HEX field	hh__	Fixed length HEX numbers only, MSB on the left
<b>Information Fields</b>		
Variable text	c--c	Variable length valid character field
Fixed alpha field	aa__	Fixed length field of uppercase or lowercase alpha characters
Fixed number field	xx__	Fixed length field of numeric characters
Fixed text field	cc__	Fixed length field of valid characters

## 3.108 NOVATELXOBS

### *NovAtel proprietary RTK correction*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

NOVATELX is a combined observation and reference station message used to transmit RTK corrections. This is a proprietary message and supports sending data for all systems.

**Message ID:** 1618

**Log Type:** Synch

**Recommended Input:**

```
log com2 novatelxobs ontime 1
```

To calculate the size of the NOVATELXOBS messages, use the following formula.

$$\text{Size} = 168 + s * (6 + p * (54 + f*33))$$

where:

s = number of systems (maximum 8)

p = number of PRN per system (maximum 64)

f = number of signals data per PRN – 1 (maximum 10 signals possible)

**Example size calculations:**

- For 2 systems (GPS and GLONASS), 12 PRN per system, and 2 signals per satellite (L1CA, L2PY)

$$\begin{aligned} \text{Size} &= 168 + 2 * (6 + 12 * (54 + 33)) \\ &= 2268 \text{ bits per second} \\ &= 284 \text{ bytes} + \text{NovAtelXHeader (8 bytes)} \end{aligned}$$

- For 3 systems (GPS, BEIDOU and GLONASS), 12 PRN per system, and 2 signals per satellite (L1CA, L2PY)

$$\begin{aligned} \text{Size} &= 168 + 3 * (6 + 12 * (54 + 33)) \\ &= 3318 \text{ bits per second} \\ &= 415 \text{ bytes} + \text{NovAtelXHeader (8 bytes)} \end{aligned}$$

- For 3 systems (GPS, BEIDOU and GLONASS), 12 PRN per system, and 3 signals per satellite (L1CA, L2PY, L2C)

$$\begin{aligned} \text{Size} &= 168 + 3 * (6 + 12 * (54 + 2*33)) \\ &= 4506 \text{ bits per second} \\ &= 564 \text{ bytes} + \text{NovAtelXHeader (8 bytes)} \end{aligned}$$

### 3.109 NOVATELXREF

*NovAtel proprietary reference station message for use in ALIGN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

NOVATELXREF is a proprietary extended reference station message for use in ALIGN configurations only. This message enables the output of the **MASTERPOS** log (see page 605), **ROVERPOS** log (see page 751) and **ALIGNBSLNENU** log (see page 401) on the rover.

**Message ID:** 1620

**Log Type:** Synch

**Recommended Input:**

```
log com2 novatelxref ontime 1
```

## 3.110 OCEANIXINFO

### *Oceanix subscription information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains details on the Oceanix subscription.

**Message ID:** 2159

**Log Type:** Asynch

**Recommended Input:**

```
log oceanixinfoa onchanged
```

**ASCII Example:**

```
#OCEANIXINFOA,COM1,0,83.0,FINESTEERING,1987,253328.270,02040020,9ce8,14635;  
"QU242:3004:3631",TERM,80001803,44,2018,0,NEARSHORE*de2b56e3
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	OCEANIXINFO header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PAC	Product activation code	Char [16]	16	H
3	Type	Subscription type (see <i>Table 135: Oceanix Subscription Type</i> on the next page)	Enum	4	H+16
4	Subscription permissions	Services permitted by the subscription (see <i>Table 136: Oceanix Subscription Details Mask</i> on the next page) <b>Note:</b> Bits in the Reserved areas of this field may be set, but the Reserved bits should be ignored.	Hex	4	H+20
5	Service End Day	Last day of the year for which service is available. Service expires at the end of this UTC day. For example, if the Service End Year and Day are 2019 and 15, respectively, then the service will expire on January 15, 2019 at 24:00 UTC.	Ulong	4	H+24
6	Service End Year	Year that the subscription ends.	Ulong	4	H+28
7	Reserved		Ulong	4	H+32
8	Region restriction	For region restricted subscriptions, the type of region restriction (see <i>Table 137: Oceanix Region Restriction</i> on the next page)	Enum	4	H+36
9	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+40
10	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 135: Oceanix Subscription Type**

ASCII	Binary	Description
UNASSIGNED	0	Decoder has not had an assigned operating mode
TERM	1	Term subscription
MODEL	5	Reserved
BUBBLE	100	Receiver is operating in an Oceanix-permitted subscription-free bubble
INCOMPATIBLE_ SUBSCRIPTION	104	Subscription is incompatible with this version of firmware

**Table 136: Oceanix Subscription Details Mask**

Bit	Mask	Description
0	0x00000001	Reserved
1	0x00000002	Oceanix - H service
2-31	0xFFFFFFFFC	Reserved

**Table 137: Oceanix Region Restriction**

ASCII	Binary	Description
NONE	0	Oceanix operation has no region restrictions
GEOGATED	1	Oceanix operation is limited to land regions. GEOGATED is also the default value reported if there is no subscription
NEARSHORE	3	Oceanix operation is limited to land and near shore (coastal) regions

### 3.111 OCEANIXSTATUS

#### *Oceanix decoder and subscription status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains status information for the Oceanix decoder and subscription.

**Message ID:** 2160

**Log Type:** Asynch

**Recommended Input:**

```
log oceanixstatusa onchanged
```

**ASCII Example:**

```
#OCEANIXSTATUSA,COM1,0,89.0,FINESTEERING,1982,315542.430,03000020,049a,32768;
ENABLE,LOCKED,IN_REGION*954083ea
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	OCEANIXSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Access	Access status. ENABLE (1) if the subscription is valid. DISABLE (0) otherwise	Enum	4	H
3	Sync state	Decoder data synchronization state (see <i>Table 138: Decoder Data Synchronization State</i> below)	Enum	4	H+4
4	Region restriction status	Region restriction status (see <i>Table 139: Region Restriction Status</i> on the next page)	Enum	4	H+8
5	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+12
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 138: Decoder Data Synchronization State**

ASCII	Binary	Description
NO_SIGNAL	0	None of the decoders have received data in the last 30 seconds
SEARCH	1	At least one decoder is receiving data and is searching for the format
LOCKED	2	At lease one decoder has locked onto the format

**Table 139: Region Restriction Status**

ASCII	Binary	Description
UNKNOWN	0	Region restriction status cannot be determined
IN_REGION	1	Receiver is within the permitted region
OUT_OF_REGION	2	Receiver is outside the permitted region

## 3.112 PASSCOM, PASSAUX, PASSUSB, PASSETH1, PASSICOM, PASSNCOM

### *Redirects data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The pass-through logging feature enables the receiver to redirect any ASCII or binary data, input at a specified port, to any specified receiver port. It allows the receiver to perform bi-directional communications with other devices such as a modem, terminal or another receiver. See also the **INTERFACEMODE** command on page 189.

There are many pass through logs: PASSCOM1, PASSCOM2, PASSCOM3, PASSCOM4, PASSCOM5, PASSCOM6, PASSAUX, PASSETH1, PASSICOM1, PASSICOM2, PASSICOM3, PASSICOM4, PASSICOM5, PASSICOM6, PASSICOM7, PASSNCOM1, PASSNCOM2, PASSNCOM3 allow for redirection of data that is arriving at COM1, COM2, COM3, virtual COM1, virtual COM2 or AUX. PASSCOM4 and PASSCOM5 are only available on OEM7600, OEM7700 and OEM7720 receivers. The AUX port is available on some products. PASSUSB1, PASSUSB2, PASSUSB3 are used to redirect data from USB1, USB2 or USB3. PASSETH1 is only available on receivers supporting Ethernet and can be used to redirect data from ETH1.

A pass through log is initiated the same as any other log, that is, log [to-port] [data-type] [trigger]. However, pass-through can be more clearly specified as: log [to-port] [from-port-AB] [onchanged]. Now, the [from-port-AB] field designates the port which accepts data (that is, COM1, COM2, COM3, COM4, COM5, COM6, AUX, USB1, USB2 or USB3) as well as the format in which the data is logged by the [to-port] (A for ASCII or B for Binary).

To pass through data arriving on all ports, use the **PASSTHROUGH** log (see page 644).

When the [from-port-AB] field is suffixed with an [A], all data received by that port is redirected to the [to-port] in ASCII format and logs according to standard NovAtel ASCII format. Therefore, all incoming ASCII data is redirected and output as ASCII data. However, any binary data received is converted to a form of ASCII hexadecimal before it is logged.

When the [from-port-AB] field is suffixed with a [B], all data received by that port is redirected to the [to-port] exactly as it is received. The log header and time tag adhere to standard NovAtel Binary format followed by the pass through data as it was received (ASCII or binary).

Pass through logs are best utilized by setting the [trigger] field as onchanged or onnew.

If the data being injected is ASCII, then the data is grouped together with the following rules:

- blocks of 80 characters
- any block of characters ending in a <CR>
- any block of characters ending in a <LF>
- any block remaining in the receiver code when a timeout occurs (100 ms)

If the data being injected is binary or the port INTERFACEMODE mode is set to GENERIC, then the data is grouped as follows:

- blocks of 80 bytes
- any block remaining in the receiver code when a timeout occurs (100 ms)

If a binary value is encountered in an ASCII output, then the byte is output as a hexadecimal byte preceded by a backslash and an x. For example 0A is output as \x0A. An actual '\ ' in the data is output as \\ . The output counts as one pass through byte although it is four characters.

The first character of each pass-through record is time tagged in GPS reference weeks and seconds.

<b>PASSAUX</b>	<b>Message ID: 690</b>

<b>PASSUSB1</b>	<b>Message ID: 607</b>
<b>PASSUSB2</b>	<b>Message ID: 608</b>
<b>PASSUSB3</b>	<b>Message ID: 609</b>

**Log Type: Asynch**

**Recommended Input:**

```
log passcom1a onchanged
```

Asynchronous logs should only be logged ONCHANGED otherwise the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

**ASCII Example 1:**

```
#PASSCOM2A,COM1,0,59.5,FINESTEERING,1337,400920.135,02000000,2b46,1984;80,
#BESTPOSA,COM3,0,80.0,FINESTEERING,1337,400920.000,02000000,4ca6,1899;
SOL_COMPUT*f9dfab46
#PASSCOM2A,COM1,0,64.0,FINESTEERING,1337,400920.201,02000000,2b46,1984;80,ED,

1.0674*807fd3ca
#PASSCOM2A,COM1,0,53.5,FINESTEERING,1337,400920.856,02000000,2b46,1984;49,,
2.2862,"",0.000,0.000,9,9,0,0,0,0,0*20b24878\x0d\x0a*3eef4220
#PASSCOM1A,COM1,0,53.5,FINESTEERING,1337,400922.463,02000000,13ff,1984;17,
unlog passcom2a\x0d\x0a*ef8d2508
```

**ASCII Example 2:**

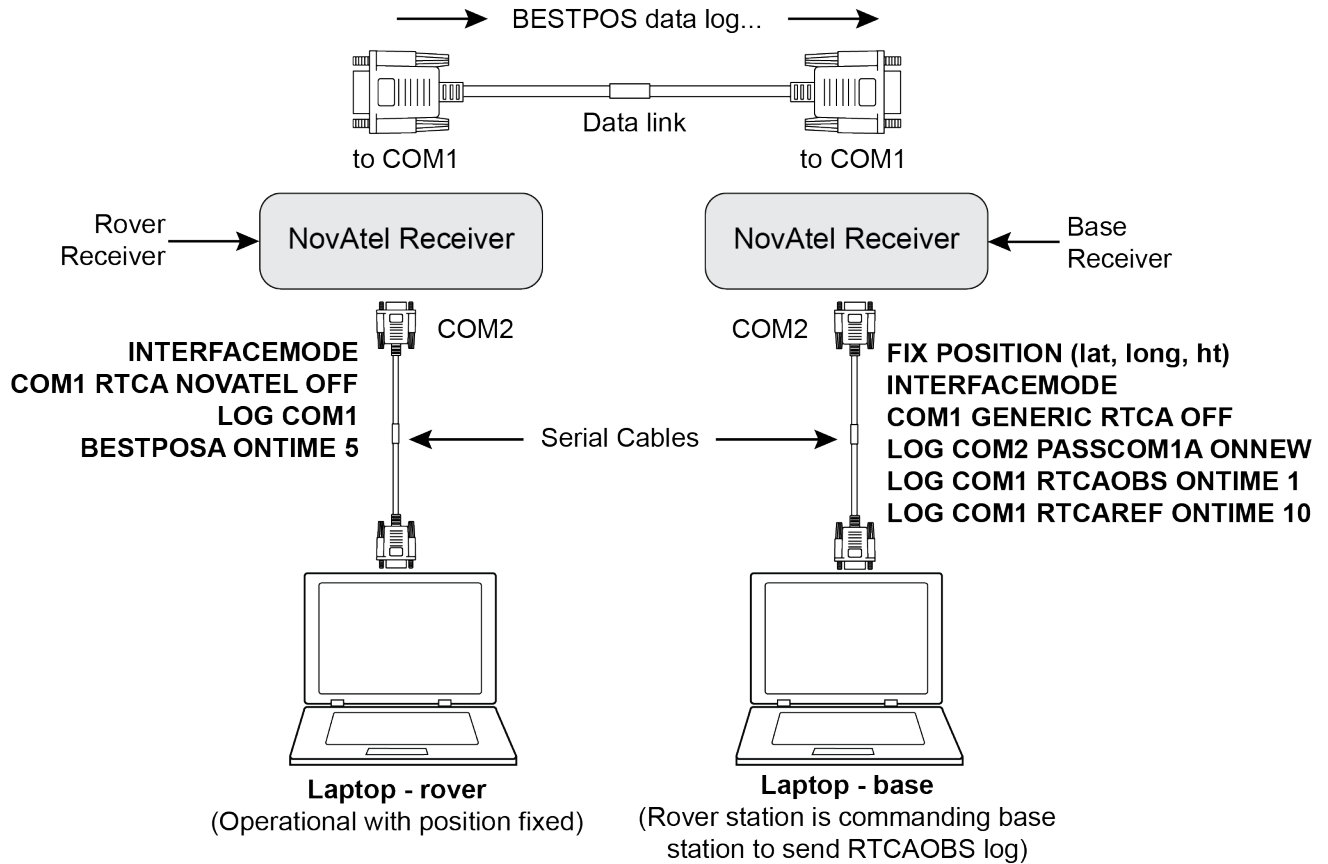

```
#PASSCOM2A,COM1,0,53.0,FINESTEERING,1337,400040.151,02000000,2b46,1984;80,\x99A
\x10\x04\x07yN&\xc6\xea\x10\x00\x01\xde\x00\x00\x10\xfe\xbf\xfe1\xfe\x9c\x14
\x03\xe2\xef\x9f\x1f\x1f\x3\xff\xd6\xff\xc3_A~z\xaa\xfe\xbf\x19\xd3\xf8\xd4\xf4-
\xe8kHo\xe2\x00>\xe0QOC>\xc3\x9c\x11\xff\x7f\xf4\xa1\xf3t\xf4'\xf4xvo\xe6\x00
\x9d*dcd2e989
```

In the example, note that '~' is a printable character.

For example, you could connect two OEM7 family receivers together via their COM1 ports such as in the *Figure 14: Pass Through Log Data* on the next page (a rover station to base station scenario). If the rover station is logging BESTPOSA data to the base station, it is possible to use the pass through logs to pass through the received BESTPOSA data to a disk file (let's call it diskfile.log) at the base station host PC hard disk.

**Figure 14: Pass Through Log Data**

Under default conditions, the two receivers "chatter" back and forth with the Invalid Command Option message (due to the command interpreter in each receiver not recognizing the command prompts of the other receiver). The chattering in turn causes the accepting receiver to transmit new pass through logs with the response data from the other receiver. To avoid the chattering problem, use the **INTERFACEMODE** command (see page 189) on the accepting port to disable error reporting from the receiving port command interpreter.

If the accepting port's error reporting is disabled by INTERFACEMODE, the BESTPOSA data record passes through and creates two records.

The reason that two records are logged from the accepting receiver is the first record was initiated by receipt of the BESTPOSA first terminator <CR>. The second record followed in response to the BESTPOSA second terminator <LF>.

Note the time interval between the first character received and the terminating <LF> can be calculated by differencing the two GPS reference time tags. This pass through feature is useful for time tagging the arrival of external messages. These messages can be any user related data. When using this feature for tagging external events, it is recommended that the rover receiver be disabled from interpreting commands so the receiver does not respond to the messages, using the **INTERFACEMODE** command (see page 189).

If the BESTPOSB binary log data is input to the accepting port (log com2 passcom1a onchanged), the BESTPOSB binary data at the accepting port is converted to a variation of ASCII hexadecimal before it is passed through to com2 port for logging.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PASSCOM header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#bytes	Number of bytes to follow	Ulong	4	H
3	data	Message data	Char [80]	80	H+4
4	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#bytes)
5	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.113 PASSTHROUGH

#### *Redirected data from all ports*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log outputs pass through data from all receiver ports. The behavior is the same as the port specific pass through logs described in *PASSCOM*, *PASSAUX*, *PASSUSB*, *PASSETH1*, *PASSICOM*, *PASSNCOM* on page 639.

**Message ID:** 1342

**Log Type:** Async

**Recommended Input:**

```
log passthrougha onchanged
```

**ASCII Example:**

```
#PASSTHROUGH, COM1, 0, 73.0, FINESTEERING, 1625, 165965.067, 02040008, 5fa3, 39275;
USB1, 80, i\xd3\x00\x87>\xb0\x00'\x91\xb3"\xa0D?\xaa\xb2\x00\x07op\x18@\x05\xe9

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PASSTHROUGH header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Port	See <i>Table 63: COM Port Identifiers</i> on page 318	Enum	4	H
3	#bytes	Number of bytes to follow	Ulong	4	H+4
4	data	Message data	Char [80]	80	H+8
5	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+8+#bytes
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.114 PDPDATUMINFO

#### *Datum information for the PDP position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **PDPPOS** log (see page 650).

**Message ID:** 2303

**Log Type:** Asynch

**Recommended Input:**

```
log pdpdatuminfoa onchanged
```

**ASCII Example:**

```
#PDPDATUMINFOA,COM1,0,66.0,FINESTEERING,2121,229669.500,02000020,f611,32768;  
"ECEF",0,2020.670,GOOD*e7dc08d3
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PDPDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the <b>PDPPOS</b> log.	Char [32]	variable	H
3	epsg_code	EPSG code of datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year) Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation Status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.115 PDPDOP

### *DOP values for the satellites in the PDP solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PDPDOP log contains the Dilution Of Precision (DOP) values for the satellites being used in the PDP solution. The PDP DOPs are updated every 60 seconds or whenever the satellites used in the PDP solution changes.

DOP values are a measure of the solution strength. Essentially, the DOPs reflect the geometry of the satellites used in the solution. Solutions with good counts of well-distributed satellites will have low DOPs and should be accurate and reliable. Solutions with fewer or poorly-distributed satellites will have high DOPs and be less accurate and reliable. As a rough guideline, PDOP values less than 4 imply a solution with reasonable geometry.

There can be many reasons for high DOP values. The most common reason is that there are obstructions limiting satellite visibility. Even if satellites are visible and being tracked they might still not be used in the solution if, for example, they are unhealthy or there are not corrections available for them. The **PDPSATS** log (see page 652) will inform which satellites are being tracked and explain why a tracked satellite is not used in the solution.

The DOPs do not consider that different satellites or signals will be weighted differently in the solution. Therefore, they do not completely reflect the solution quality. Ultimately, the standard deviations reported in the **PDPPOS** log (see page 650) are the best reflection of the solution accuracy.

**Message ID:** 1998

**Log Type:** Asynch

**Recommended Input:**

```
log pdpdopa onchanged
```

**ASCII Example:**

```
#PDPDOPA,USB1,0,82.0,FINESTEERING,2010,149390.500,02000008,3bf3,32768;1.6490,0.9960,0.5950,0.7950,0.5280,5.0,22,3,28,19,6,2,24,12,22,17,1,50,59,61,52,60,51,1,30,12,11,6,9*13e052ef
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PDPDOP header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	gdop	Geometric dilution of precision - assumes 3D position and receiver clock offset (all 4 parameters) are unknown	Float	4	H
3	pdop	Position dilution of precision - assumes 3D position is unknown and receiver clock offset is known	Float	4	H+4
4	hdop	Horizontal dilution of precision	Float	4	H+8
5	htdop	Horizontal position and time dilution of precision	Float	4	H+12
6	tdop	GPS time dilution of precision – assumes 3D position is known and only the GPS receiver clock offset is unknown	Float	4	H+16

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7	cutoff	GPS elevation cut-off angle	Float	4	H+20
8	#PRN	Number of satellites PRNs to follow	Long	4	H+24
9	PRN	PRN of a satellite used in the position solution	Ulong	4	H+28
10	Next PRN offset = $H+28+(\#prn \times 4)$				
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+28+ (#prn x 4)
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.116 PDPDOP2

#### *DOP values for the satellites used in the PDP solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PDPDOP2 log contains the Dilution Of Precision (DOP) values for the satellites being used in the PDP solution. This log is similar to the **PDPDOP** log (see page 646) but contains the per-system TDOPs; see the **PDPDOP** log on page 646 for more information on the DOPs.

**Message ID:** 1995

**Log Type:** Asynch

**Recommended Input:**

```
log pdpdop2a onchanged
```

**ASCII Example:**

```
#PDPDOP2A,USB1,0,82.0,FINESTEERING,2010,149390.500,02000008,2488,32768;1.6490,0.9960,0.5950,0.7990,4,GPS,0.5280,GLONASS,0.6880,GALILEO,0.7200,BEIDOU,0.6750*25f8324a
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PDPDOP2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	GDOP	Geometric dilution of precision - assumes 3D position and receiver clock offset (all 4 parameters) are unknown	Float	4	H
3	PDOP	Position dilution of precision - assumes 3D position is unknown and receiver clock offset is known	Float	4	H+4
4	HDOP	Horizontal dilution of precision	Float	4	H+8
5	VDOP	Vertical dilution of precision	Float	4	H+12
6	#systems	Number of systems	Ulong	4	H+16
7	system	See <i>Table 140: System Used for Timing</i> on the next page	Enum	4	H+20
8	TDOP	Time dilution of precision	Float	4	H+24
9	Next system offset = H+20+(#systems x 8)				
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+20+ (#systems x 8)
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 140: System Used for Timing**

<b>Binary</b>	<b>ASCII</b>
0	GPS <sup>1</sup>
1	GLONASS
2	GALILEO
3	BEIDOU
4	NAVIC
99	AUTO <sup>2</sup>

---

<sup>1</sup>GPS setting includes QZSS satellites.

<sup>2</sup>AUTO is used only as a backup system (not available for primary system field).

## 3.117 PDPPOS

### *PDP filter position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PDPPOS log contains the receiver position computed by the receiver with the PDP filter enabled. See also the **PDPFILTER** command on page 248.

**Message ID:** 469

**Log Type:** Synch

**Recommended Input:**

```
log pdpposa ontime 1
```

**ASCII Example:**

```
#PDPPOSA, COM1, 0, 75.5, FINESTEERING, 1431, 494991.000, 02040000, a210, 35548;  
SOL_COMPUTED, SINGLE, 51.11635010310, -114.03832575772, 1065.5019, -16.9000, WGS84,  
4.7976, 2.0897, 5.3062, "", 0.000, 0.000, 8, 8, 0, 0, 0, 0, 0, 0*3cbfa646
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PDPPOS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status (refer to <i>Table 80: Solution Status</i> on page 432)	Enum	4	H
3	pos type	Position type (refer to <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+4
4	lat	Latitude (degrees)	Double	8	H+8
5	lon	Longitude (degrees)	Double	8	H+16
6	hgt	Height above mean sea level (m)	Double	8	H+24
7	undulation	Undulation - the relationship between the geoid and the WGS84 ellipsoid (m)  <div style="border: 1px solid black; padding: 5px; width: fit-content;">  When using a datum other than WGS84, the undulation value also includes the vertical shift due to differences between the datum in use and WGS84.           </div>	Float	4	H+32
8	datum id#	Datum ID number 61 = WGS84 63 = USER	Enum	4	H+36

Field	Field type	Description	Format	Binary Bytes	Binary Offset
9	lat $\sigma$	Latitude standard deviation (m)	Float	4	H+40
10	lon $\sigma$	Longitude standard deviation (m)	Float	4	H+44
11	hgt $\sigma$	Height standard deviation (m)	Float	4	H+48
12	stn id	Base station ID	Char[4]	4	H+52
13	diff_age	Differential age in seconds	Float	4	H+56
14	sol_age	Solution age in seconds	Float	4	H+60
15	#sats	Number of satellites tracked	Uchar	1	H+64
16	#sats soln	Number of satellites in the solution	Uchar	1	H+65
17	Reserved		Uchar	1	H+66
18			Uchar	1	H+67
19			Hex	1	H+68
20	ext sol stat	Extended solution status (see <i>Table 84: Extended Solution Status</i> on page 436)	Hex	1	H+69
21	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+70
22	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+71
23	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+72
24	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.118 PDPSATS

### *Satellites used in PDPPPOS solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists the used and unused satellites for the corresponding PDPPPOS solution. It also describes the signals of the used satellites and reasons for exclusions.

**Message ID:** 1234

**Log Type:** Synch

**Recommended Input:**

```
log pdpsatsa ontime 1
```

**Abbreviated ASCII Example:**

```
<PDPSATS COM1 0 80.0 FINESTEERING 1690 603073.000 02000008 be33 43488
< 21
< GPS 11 GOOD 00000001
< GPS 27 GOOD 00000001
...
< GPS 1 GOOD 00000001
< GPS 7 GOOD 00000001
< SBAS 133 NOTUSED 00000000
< SBAS 138 NOTUSED 00000000
< SBAS 135 NOTUSED 00000000
< GLONASS 10-7 GOOD 00000001
< GLONASS 21+4 GOOD 00000001
...
< GLONASS 12-1 GOOD 00000001
< GLONASS 11 GOOD 00000001
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PDPSATS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	system	See <i>Table 118: Satellite System</i> on page 561	Enum	4	H+4
4	Satellite ID	Satellite identifier	Ulong	4	H+8
5	Status	Satellite status (see <i>Table 86: Observation Statuses</i> on page 438)	Enum	4	H+12

Field	Field type	Description	Format	Binary Bytes	Binary Offset
6	Status mask	See Table 87: GPS Signal Mask on page 439, Table 88: GLONASS Signal Mask on page 439, Table 89: Galileo Signal Mask on page 440, Table 90: BeiDou Signal Mask on page 440, Table 91: QZSS Signal Mask on page 440 and Table 92: NavIC Signal Mask on page 440	Hex	4	H+16
7	Next satellite offset = H+4+(#sat x 16)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#sat x 16)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.119 PDPVEL

### *PDP filter velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PDPVEL log contains the pseudorange velocity computed by the receiver with the PDP filter enabled. See also the **PDPFILTER** command on page 248.

**Message ID:** 470

**Log Type:** Synch

**Recommended Input:**

```
log pdpvela ontime 1
```

**ASCII Example:**

```
#PDPVELA,COM1,0,75.0,FINESTEERING,1430,505990.000,02000000,b886,2859;  
SOL_COMPUTED,SINGLE,0.150,0.000,27.4126,179.424617,-0.5521,0.0*7746b0fe
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PDPVEL header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status (refer to <i>Table 80: Solution Status</i> on page 432)	Enum	4	H
3	vel type	Velocity type (refer to <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+4
4	latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results	Float	4	H+8
5	age	Differential age in seconds	Float	4	H+12
6	hor spd	Horizontal speed over ground, in meters per second	Double	8	H+16
7	trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees	Double	8	H+24
8	height	Height in meters where positive values indicate increasing altitude (up) and negative values indicate decreasing altitude (down)	Double	8	H+32
9	Reserved		Float	4	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.120 PDPXYZ

### *PDP filter Cartesian position and velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PDPXYZ log contains the Cartesian position in X, Y and Z coordinates as computed by the receiver with the PDP filter enabled. See also the **PDPFILTER** command on page 248.

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID:** 471

**Log Type:** Synch

**Recommended Input:**

```
log pdpxyza ontime 1
```

**ASCII Example:**

```
#PDPXYZA, COM1, 0, 75.5, FINESTEERING, 1431, 494991.000, 02040000, 33ce, 35548;

3.0153, SOL_COMPUTED, SINGLE, -2.5588e-308, -3.1719e-308, 3.9151e-308, 0.0100, 0.0100,
0.0100, "", 0.150, 0.000, 0.000, 8, 8, 0, 0, 0, 0, 0, 0, 0*a20dbd4f
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PDPXYZ header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	P-sol status	Solution status (refer to <i>Table 80: Solution Status</i> on page 432)	Enum	4	H
3	pos type	Position type (refer to <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+4
4	P-X	Position X-coordinate (m)	Double	8	H+8
5	P-Y	Position Y-coordinate (m)	Double	8	H+16
6	P-Z	Position Z-coordinate (m)	Double	8	H+24
7	P-X $\sigma$	Standard deviation of P-X (m)	Float	4	H+32
8	P-Y $\sigma$	Standard deviation of P-Y (m)	Float	4	H+36
9	P-Z $\sigma$	Standard deviation of P-Z (m)	Float	4	H+40
10	V-sol status	Solution status (refer to <i>Table 80: Solution Status</i> on page 432)	Enum	4	H+44

Field	Field type	Description	Format	Binary Bytes	Binary Offset
11	vel type	Velocity type (refer to <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+48
12	V-X	Velocity vector along X-axis (m)	Double	8	H+52
13	V-Y	Velocity vector along Y-axis (m)	Double	8	H+60
14	V-Z	Velocity vector along Z-axis (m)	Double	8	H+68
15	V-X $\sigma$	Standard deviation of V-X (m)	Float	4	H+76
16	V-Y $\sigma$	Standard deviation of V-Y (m)	Float	4	H+80
17	V-Z $\sigma$	Standard deviation of V-Z (m)	Float	4	H+84
18	stn ID	Base station ID	Char[4]	4	H+88
19	V-latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results	Float	4	H+92
20	diff_age	Differential age in seconds	Float	4	H+96
21	sol_age	Solution age in seconds	Float	4	H+100
22	#sats	Number of satellite vehicles tracked	Uchar	1	H+104
23	#sats soln	Number of satellite vehicles used in solution	Uchar	1	H+105
24	Reserved		Uchar	1	H+106
25			Uchar	1	H+107
26			Uchar	1	H+108
27	ext sol stat	Extended solution status (see <i>Table 84: Extended Solution Status</i> on page 436)	Hex	1	H+109
28	Galileo and BeiDou sig mask	Galileo and BeiDou signals used mask (see <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+110
29	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435)	Hex	1	H+111
30	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+112
31	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.121 PORTSTATS

### Port statistics

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log conveys various status parameters of the receiver's communication ports. The receiver maintains a running count of a variety of status indicators of the data link. This log outputs a report of those indicators.

**Message ID:** 72

**Log Type:** Polled

**Recommended Input:**

```
log portstatsa once
```

**ASCII example:**

```
#PORTSTATSA,USB1,0,69.5,FINESTEERING,1971,489026.000,02004020,a872,14434;29,COM

,0,0,0,0,0,0,ICOM6,0,0,0,0,0,0,0,0,0,0,ICOM7,0,0,0,0,0,0,0,0,0,0*9c28761
```

Parity and framing errors occur for COM ports if poor transmission lines are encountered or if there is an incompatibility in the data protocol. If errors occur, you may need to confirm the bit rate, number of data bits, number of stop bits and parity of both the transmit and receiving ends. Characters may be dropped when the CPU is overloaded.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PORTSTATS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#port	Number of ports with information to follow	Long	4	H
3	port	Refer to <i>Table 32: Communications Port Identifiers</i> on page 136	Enum	4	H+4
4	rx chars	Total number of characters received through this port	Ulong	4	H+8
5	tx chars	Total number of characters transmitted through this port	Ulong	4	H+12

Field	Field type	Description	Format	Binary Bytes	Binary Offset
6	acc rx chars	Total number of accepted characters received through this port	Ulong	4	H+16
7	dropped rx chars	Number of software overruns in receive	Ulong	4	H+20
8	interrupts	Number of interrupts on this port	Ulong	4	H+24
9	breaks	Number of breaks (only for serial ports)	Ulong	4	H+28
10	par err	Number of parity errors (only for serial ports)	Ulong	4	H+32
11	frame err	Number of framing errors (only for serial ports)	Ulong	4	H+36
12	rx overruns	Number of hardware overruns in receive	Ulong	4	H+40
13	Next port offset = $H+4+(\#port \times 40)$				
14	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#port x 40)
15	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.122 PPPDATUMINFO

### *Datum information for the PPP position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **PPPPOS** log (see page 660).

**Message ID:** 2293

**Log Type:** Asynch

**Recommended Input:**

```
log pppdatuminfoa onchanged
```

**ASCII Example:**

```
#PPPDATUMINFOA, COM1, 0, 75.5, FINESTEERING, 2044, 510000.000, 02000020, ea8d, 15427;  
"ITRF2014", 1165, 2019.202, GOOD*2f28701e
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PPPDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the <b>PPPPOS</b> log.	Char [32]	variable	H
3	epsg_code	EPSG code of datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year) Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation Status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.123 PPPPOS

### *PPP filter position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the position solution computed by the PPP filter.

**Message ID:** 1538

**Log Type:** Synch

**Recommended Input:**

```
log pppposa ontime 1
```

**ASCII Example:**

```
#PPPPOSA,COM1,0,80.0,FINESTEERING,1735,345300.000,02000000,6f47,44027;  
SOL_COMPUTED,PPP,51.11635350286,-114.03819287079,1064.5365,-16.9000,  
WGS84,0.0375,0.0460,0.0603,"0",4.000,0.000,12,12,12,12,0,00,00,03*ef17d668
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PPPPOS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Status	Solution status (see <i>Table 80: Solution Status</i> on page 432)	Enum	4	H
3	Type	Position type (see <i>Table 141: Position Type</i> on the next page)	Enum	4	H+4
4	lat	Latitude (degrees)	Double	8	H+8
5	lon	Longitude (degrees)	Double	8	H+16
6	hgt	Height above mean sea level (m)	Double	8	H+24
7	undulation	Undulation - the relationship between the geoid and the WGS84 ellipsoid (m) <sup>1</sup>	Float	4	H+32
8	datum id#	Datum ID number 61 = WGS84 63 = USER	Enum	4	H+36
9	lat $\sigma$	Latitude standard deviation (m)	Float	4	H+40
10	lon $\sigma$	Longitude standard deviation (m)	Float	4	H+44
11	hgt $\sigma$	Height standard deviation (m)	Float	4	H+48

<sup>1</sup>When using a datum other than WGS84, the undulation value also includes the vertical shift due to differences between the datum in use and WGS84.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
12	stn id	Base station ID	Char[4]	4	H+52
13	diff_age	Differential age in seconds	Float	4	H+56
14	sol_age	Solution age in seconds	Float	4	H+60
15	#SVs	Number of satellites tracked	Uchar	1	H+64
16	#solnSVs	Number of satellites used in solution	Uchar	1	H+65
17	#ggL1	Number of satellites with L1/E1/B1 signals used in solution	Uchar	1	H+66
18	#solnMultiSVs	Number of satellites with multi-frequency signals used in solution	Uchar	1	H+67
19	Reserved		Hex	1	H+68
20	ext sol stat	Extended solution status (see <i>Table 84: Extended Solution Status</i> on page 436)	Hex	1	H+69
21	Reserved		Hex	1	H+70
22	GPS and GLONASS sig mask	GPS and GLONASS signals used mask (see <i>Table 82: GPS and GLONASS Signal-Used Mask</i> on page 435 or <i>Table 83: Galileo and BeiDou Signal-Used Mask</i> on page 435)	Hex	1	H+71
23	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+72
24	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 141: Position Type

ASCII	Binary	Description
NONE	0	No solution
PPP_CONVERGING	68	Converging TerraStar-C, TerraStar-C PRO, TerraStar-X solution
PPP	69	Converged TerraStar-C, TerraStar-C PRO, TerraStar-X solution
PPP_BASIC_CONVERGING	77	Converging TerraStar-L solution
PPP_BASIC	78	Converged TerraStar-L solution

## 3.124 PPPSATS

### *Satellites used in the PPPPOS solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists the used and unused satellites for the corresponding PPPPOS solution. It also describes the signals of the used satellites and reasons for exclusions.

**Message ID:** 1541

**Log Type:** Synch

**Recommended Input:**

```
log pppsatsa ontime 1
```

**Abbreviated ASCII Example:**

```
<PPPSATS COM1 0 80.0 FINESTEERING 1735 345300.000 02000000 ce3f 44027
< 12
< GPS 3 GOOD 00000003
< GPS 5 GOOD 00000003
< GPS 6 GOOD 00000003
< GPS 7 GOOD 00000003
< GPS 8 GOOD 00000003
< GPS 10 GOOD 00000003
< GPS 13 GOOD 00000003
< GPS 16 GOOD 00000003
< GPS 19 GOOD 00000003
< GPS 23 GOOD 00000003
< GPS 26 GOOD 00000003
< GPS 28 GOOD 00000003
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PPPSATS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#entries	Number of records to follow	Ulong	4	H
3	System	Satellite system (see <i>Table 118: Satellite System</i> on page 561)	Enum	4	H+4

Field	Field type	Description	Format	Binary Bytes	Binary Offset
4	Satellite ID	In binary logs, the satellite ID field is 4 bytes. The 2 lowest-order bytes, interpreted as a USHORT, are the system identifier: for instance, the PRN for GPS, or the slot for GLONASS. The 2 highest-order bytes are the frequency channel for GLONASS, interpreted as a SHORT and zero for all other systems.  In ASCII and abbreviated ASCII logs, the satellite ID field is the system identifier. If the system is GLONASS and the frequency channel is not zero, then the signed channel is appended to the system identifier. For example, slot 13, frequency channel -2 is output as 13-2.	Ulong	4	H+8
5	Status	Satellite status (see <i>Table 86: Observation Statuses</i> on page 438)	Enum	4	H+12
6	Signal Mask	Signals used in the solution (see <i>Table 87: GPS Signal Mask</i> on page 439, <i>Table 88: GLONASS Signal Mask</i> on page 439, <i>Table 89: Galileo Signal Mask</i> on page 440, <i>Table 90: BeiDou Signal Mask</i> on page 440, <i>Table 91: QZSS Signal Mask</i> on page 440 and <i>Table 92: NavIC Signal Mask</i> on page 440)	Hex	4	H+16
7	Next satellite offset = H + 4 + (#entries x 16)				
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#entries x 16)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.125 PPPSEEDAPPLICATIONSTATUS

### *Progress or outcome of the latest PPP seeding attempt*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log is used to report the progress or outcome of the latest attempt to apply a static PPP seed. For a static seed to shorten the PPP convergence time, the receiver must remain stationary until this log indicates motion is permitted. The receiver may move during **PENDING\_MOTION\_ALLOWED** and seeding and fast convergence will be successful, but the reported accuracy will be highest if the receiver remains stationary until **APPLIED** status, which normally takes about two minutes longer. Large movements between recording the seed and the end of **PENDING** status will result in the seed being discarded and a full convergence taking place; but movements during this time of less than 10m may cause an incorrect seed to be applied and an incorrect PPP solution to be reported for a few minutes before this is discovered. This can be avoided by erasing the seed with **PPPSEED CLEAR**. A status of **APPLIED** means that a seed was successfully applied.

The **PPPSEED** command (see page 261) is used to control the application of seeds. Seeds can be manually applied by **PPPSEED SET** or **RESTORE**, or automatically by **PPPSEED AUTO**.

**PPPSEEDAPPLICATIONSTATUS** does not report the results of the **PPPDYNAMICSEED** command (see page 258).

**Message ID 2250**

**Log type: Asynch**

**Recommended Input**

```
log pppseedapplicationstatusa onchanged
```

### ASCII Example

```
#PPPSEEDAPPLICATIONSTATUSA,COM1,0,77.5,FINESTEERING,2017,505640.391,02000000,
f8c2,32768;PENDING,51.11637026243,-114.03825414820,1047.6422,0.0534,0.0523,
0.0824*3a5e7250
```

```
#PPPSEEDAPPLICATIONSTATUSA,COM1,0,75.0,FINESTEERING,2017,505680.000,02000000,
f8c2,32768;APPLIED,51.11637026243,-114.03825414820,1047.6422,0.0534,0.0523,
0.0824*390a7178
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PPPSEEDAPPLICATION STATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Status	See <i>Table 142: PPP Seed Application Status</i> on the next page.	Enum	4	H
3	Latitude	Latitude Range: ±90 (degrees)	Double	8	H+4
4	Longitude	Longitude Range: ±180 (degrees)	Double	8	H+12

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
5	Height	Ellipsoidal height Range: > -2000 (m)	Double	8	H+20
6	Latitude std. dev.	Latitude standard deviation (m)	Float	4	H+28
7	Longitude std. dev.	Longitude standard deviation (m)	Float	4	H+32
8	Height std. dev.	Ellipsoidal height standard deviation (m)	Float	4	H+36
9	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+40
10	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

Table 142: PPP Seed Application Status

Binary	ASCII	Description
0	UNAVAILABLE	No seed was stored in NVM before the time of seeding or has been set, so a full convergence solution will be provided. Move as desired.
1	AVAILABLE	A seed is stored in NVM but seeding is not enabled, so a full convergence solution will be provided. Either enable seeding or move as desired.
2	PENDING	A seed is stored in NVM or has been set and seeding is enabled and the system is waiting to be able to use the seed for rapid convergence. Remain stationary.
3	APPLIED	The system has used the seed to complete rapid convergence. Move as desired.
4	PENDING_MOTION_ALLOWED	The system is currently able to use the seed for rapid convergence. The receiver may move with minor loss of accuracy or remain stationary for a minute or two to improve convergence accuracy.
10	REJECTED_MOTION_DETECTED	The seed was rejected because motion was detected or explicitly set via PPPDYNAMICS DYNAMIC (see <b>PPPDYNAMICS</b> command on page 257) before the seed could be used. A full convergence solution will be provided. Move as desired.
11	REJECTED_BAD_POSITION	The seed and seeded solution were discarded because the seed position was found to be incorrect. A full convergence solution will be provided. Move as desired. Note the possibility that an incorrect position may have been reported as accurate before this point.
20	DISCARDED_RAPID_CONVERGENCE	A seed was not required for fast convergence of the available solution so it was not used. Move as desired.

## 3.126 PPPSEEDSTORESTATUS

### *Status of the NVM-stored PPP seed*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the availability of the PPP seed stored in NVM. When the status is **AVAILABLE**, a seed has been stored in NVM and is available for recall.

Seed storing and recall is controlled by the **PPPSEED** command (see page 261).

**Message ID 2251**

**Log type:** Asynch

**Recommended Input**

```
log pppseedstorestatusa onchanged
```

**ASCII Example**

```
#PPPSEEDSTORESTATUSA,COM1,0,76.0,FINESTEERING,2017,502402.000,02000000,edad,32768;AVAILABLE,0.071*bb8a343c
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PPPSEEDSTORESTATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Status	Status of the stored PPP seed: 0 = UNAVAILABLE 1 = AVAILABLE	Enum	4	H
3	Horizontal std. dev.	Horizontal standard deviation (meters)	Float	4	H+4
4	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+8
5	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.127 PROFILEINFO

### *Profile information in NVM*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log outputs a list of Profiles in the system. Refer also to the **PROFILE** command on page 269.

A list may consist of a maximum of 20 profiles.

**Message ID:** 1412

**Log Type:** Polled

**Recommended Input:**

```
log profileinfoa onchanged
```

**ASCII Examples:**

```
#PROFILEINFOA, COM1, 0, 84.0, UNKNOWN, 0, 17539.339, 024c0020, ae3a, 10526;
"BASE", 0, 2,
"LOG VERSION",
"SERIALCONFIG COM2 230400"*0ad5cda5
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PROFILEINFO header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Name	Profile Name	String [Max 20]	variable <sup>1</sup>	H
3	Status Word	Refer to <i>Table 143: Status Word</i> on the next page	Ulong	4	variable
4	# of Commands	Number of commands assigned to the Profile	Ulong	4	variable
5	Command	Profile command	String [Max 150]	variable <sup>1</sup>	variable
6	Next command offset = variable				
7	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	variable
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

**Table 143: Status Word**

Bit #	Mask	Description
0	0x00000001	Activate Flag (0 – Deactivate (default), 1 –Activate)
1 – 3	0x0000000E	Reserved
4	0x00000010	Command 1 validation Flag (0 – Valid (default), 1 – Invalid)
5	0x00000020	Command 2 validation Flag
6	0x00000040	Command 3 validation Flag
7	0x00000080	Command 4 validation Flag
8	0x00000100	Command 5 validation Flag
9	0x00000200	Command 6 validation Flag
10	0x00000400	Command 7 validation Flag
11	0x00000800	Command 8 validation Flag
12	0x00001000	Command 9 validation Flag
13	0x00002000	Command 10 validation Flag
14	0x00004000	Command 11 validation Flag
15	0x00008000	Command 12 validation Flag
16	0x00010000	Command 13 validation Flag
17	0x00020000	Command 14 validation Flag
18	0x00040000	Command 15 validation Flag
19	0x00080000	Command 16 validation Flag
20	0x00100000	Command 17 validation Flag
21	0x00200000	Command 18 validation Flag
22	0x00400000	Command 19 validation Flag
23	0x00800000	Command 20 validation Flag
24 - 31	0xFF000000	Reserved

## 3.128 PSRDATUMINFO

### *Datum information for the pseudorange position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **PSRPOS** log (see page 674).

**Message ID:** 2300

**Log Type:** Asynch

**Recommended Input:**

```
log psrdatuminfoa onchanged
```

**ASCII Example:**

```
#PSRDATUMINFOA,COM1,0,65.0,FINESTEERING,2121,229500.000,02000020,f85f,32768;  
"ECEF",0,2020.670,GOOD*c700524f
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	PSRDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the <b>PSRPOS</b> log.	Char [32]	variable	H
3	epsg_code	EPSG code of datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year) Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation Status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.129 PSRDOP

### *DOP values for the satellites used in the PSR solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PSRDOP log contains the Dilution Of Precision (DOP) values for the satellites being used in the PSR solution. The PSR DOPs are updated every 60 seconds or whenever the satellites used in the PSR solution changes.

DOP values are a measure of the solution strength. Essentially, the DOPs reflect the geometry of the satellites used in the solution. Solutions with good counts of well-distributed satellites will have low DOPs and should be accurate and reliable. Solutions with fewer or poorly-distributed satellites will have high DOPs and be less accurate and reliable. As a rough guideline, PDOP values less than 4 imply a solution with reasonable geometry.

There can be many reasons for high DOP values. The most common reason is that there are obstructions limiting satellite visibility. Even if satellites are visible and being tracked they might still not be used in the solution if, for example, they are unhealthy or there are not corrections available for them. The **PSRSATS** log (see page 676) will inform which satellites are being tracked and explain why a tracked satellite is not used in the solution.

The DOPs do not consider that different satellites or signals will be weighted differently in the solution. Therefore, they do not completely reflect the solution quality. Ultimately, the standard deviations reported in the **PSRPOS** log (see page 674) are the best reflection of the solution accuracy.

1. If a satellite is locked out using the **LOCKOUT** command (see page 213), it will still show in the prn list but it will be significantly deweighted in the dop calculation.
2. The vertical dilution of precision can be calculated by:  

$$vdop = \sqrt{pdop^2 - hdop^2}$$
3. If the DOP is not yet calculated, a default value of 9999.0 is displayed.

**Message ID:** 174

**Log Type:** Asynch

**Recommended Input:**

```
log psrdopa onchanged
```

**ASCII Example:**

```
#PSRDOPA, COM1, 0, 56.5, FINESTEERING, 1337, 403100.000, 02000000, 768f, 1984; 1.9695, 1.7613, 1.0630, 1.3808, 0.8812, 5.0, 10, 14, 22, 25, 1, 24, 11, 5, 20, 30, 7*106de10a
```

Field	Field type		Format	Binary Bytes	Binary Offset
1	PSRDOP header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	gdop	Geometric dilution of precision - assumes 3D position and receiver clock offset (all 4 parameters) are unknown	Float	4	H

Field	Field type		Format	Binary Bytes	Binary Offset
3	pdop	Position dilution of precision - assumes 3D position is unknown and receiver clock offset is known	Float	4	H+4
4	hdop	Horizontal dilution of precision.	Float	4	H+8
5	htdop	Horizontal position and time dilution of precision.	Float	4	H+12
6	tdop	GPS time dilution of precision – assumes 3D position is known and only the GPS receiver clock offset is unknown	Float	4	H+16
7	cutoff	GPS elevation cut-off angle	Float	4	H+20
8	#PRN	Number of satellites PRNs to follow	Long	4	H+24
9	PRN	PRN of SV PRN tracking, null field until position solution available	Ulong	4	H+28
10...	Next PRN offset = H+28+(#pm x 4)				
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+28+ (#pm x 4)
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.130 PSRDOP2

#### *DOP values for the satellites used in the PSR solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PSRDOP2 log contains the Dilution Of Precision (DOP) values for the satellites being used in the PSR solution. This log is similar to the **PSRDOP** log (see page 670) but contains the per-system TDOPs; see the **PSRDOP** log on page 670 for more information on the DOPs.

**Message ID:** 1163

**Log Type:** Asynch

**Recommended Input:**

```
log psrdop2a onchanged
```

**ASCII Example:**

```
#PSRDOP2A,COM1,0,89.5,FINESTEERING,1613,164820.000,02000008,0802,39031;1.6740,1.3010,0.6900,1.1030,2,GPS,0.6890,GLONASS,0.7980*5dd123d0.
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PSRDOP2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	GDOP	Geometric dilution of precision - assumes 3D position and receiver clock offset (all 4 parameters) are unknown	Float	4	H
3	PDOP	Position dilution of precision - assumes 3D position is unknown and receiver clock offset is known	Float	4	H+4
4	HDOP	Horizontal dilution of precision	Float	4	H+8
5	VDOP	Vertical dilution of precision	Float	4	H+12
6	#systems	Number of systems	Ulong	4	H+16
7	system	See <i>Table 144: System Used for Timing</i> on the next page	Enum	4	H+20
8	TDOP	Time dilution of precision	Float	4	H+24
9	Next satellite offset = H+20+(#systems x 8)				
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+20+ (#systems x 8)
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 144: System Used for Timing**

<b>Binary</b>	<b>ASCII</b>
0	GPS <sup>1</sup>
1	GLONASS
2	GALILEO
3	BEIDOU
4	NAVIC
99	AUTO <sup>2</sup>

---

<sup>1</sup>GPS setting includes QZSS satellites.

<sup>2</sup>AUTO is used only as a backup system (not available for primary system field).

## 3.131 PSRPOS

### *Pseudorange position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the position computed by the receiver, along with three status flags. In addition, it reports other status indicators, including differential age, which is useful in predicting anomalous behavior brought about by outages in differential corrections.

**Message ID:** 47

**Log Type:** Synch

**Recommended Input:**

```
log psrposa ontime 1
```

**ASCII Example:**

```
#PSRPOSA,COM1,0,58.5,FINESTEERING,1419,340037.000,02000040,6326,2724;

```

There are DGPS use cases in which the base receiver is not maintained or controlled by the positioning user. For example, the US Coast Guard operates a differential correction service which broadcasts GPS differential corrections over marine radio beacons. As a user, all you need is a marine beacon receiver and a GNSS receiver to achieve positioning accuracy of less than 1 meter. In this case, the Coast Guard owns and operates the base receiver at known coordinates. Other examples of users appearing to use only one GNSS receiver include FM radio station correction services, privately owned radio transmitters and corrections carried by communication satellites. Some of the radio receivers have built-in GNSS receivers and combined antennas, so they even appear to look as one self-contained unit.

The major factors degrading GPS signals which can be removed or reduced with differential methods are the atmosphere, ionosphere, satellite orbit errors, and satellite clock errors. Some errors which are not removed include receiver noise and multipath.

Field	Field type	Description	Format	Binary Bytes	Binary Offset

24	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>When using a datum other than WGS84, the undulation value also includes the vertical shift due to differences between the datum in use and WGS84.

## 3.132 PSRSATS

### *Satellites used in PSRPOS solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log lists the used and unused satellites for the corresponding PSRPOS solution. It also describes the signals of the used satellites and reasons for exclusions.

**Message ID:** 1162

**Log Type:** Synch

**Recommended Input:**

```
log psrsats ontime 1
```

**Abbreviated ASCII Example:**

```

### 3.133 PSRVEL

#### *Pseudorange velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

In the PSRVEL log, the actual speed and direction of the receiver antenna over ground is provided. The velocity measurements sometimes have a latency associated with them. The time of validity is the time tag in the log minus the latency value.

In a PSRVEL log, the actual speed and direction of the receiver antenna over ground is provided. The receiver does not determine the direction a vessel, craft or vehicle is pointed (heading) but rather the direction of motion of the GNSS antenna relative to ground.

The velocity in the PSRVEL log is determined by the pseudorange filter. Velocities from the pseudorange filter are calculated from the Doppler.

The velocity status indicates varying degrees of velocity quality. To ensure healthy velocity, the velocity sol-status must also be checked. If the sol-status is non-zero, the velocity is likely invalid. It should be noted that the receiver does not determine the direction a vessel, craft, or vehicle is pointed (heading), but rather the direction of the motion of the GPS antenna relative to the ground.

The latency of the instantaneous Doppler velocity is always 0.15 seconds. The latency represents an estimate of the delay caused by the tracking loops under acceleration of approximately 1 G. For most users, the latency can be assumed to be zero (instantaneous velocity).

**Message ID:** 100

**Log Type:** Synch

**Recommended Input:**

```
log psrvela ontime 1
```

**ASCII Example:**

```
#PSRVELA,COM1,0,52.5,FINESTEERING,1337,403362.000,02000000,658b,1984;  
SOL_COMPUTED,PSRDIFF,0.250,9.000,0.0698,26.582692,0.0172,0.0*a94e5d48
```

Consider the case where vehicles are leaving a control center. The control center's coordinates are known but the vehicles are on the move. Using the control center's position as a reference, the vehicles are able to report where they are with PSRPOS and their speed and direction with PSRVEL at any time.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	PSRVEL header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H

Field	Field type	Description	Format	Binary Bytes	Binary Offset
3	vel type	Velocity type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results	Float	4	H+8
5	age	Differential age in seconds	Float	4	H+12
6	hor spd	Horizontal speed over ground, in meters per second	Double	8	H+16
7	trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees	Double	8	H+24
8	vert spd	Vertical speed, in meters per second, where positive values indicate increasing altitude (up) and negative values indicate decreasing altitude (down)	Double	8	H+32
9	Reserved		Float	4	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.134 PSRXYZ

#### *Pseudorange Cartesian position and velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the receiver's pseudorange position and velocity in ECEF coordinates. The position and velocity status field's indicate whether or not the corresponding data is valid. See *Figure 12: The WGS84 ECEF Coordinate System* on page 448 for a definition of the ECEF coordinates.

The velocity status indicates varying degrees of velocity quality. To ensure healthy velocity, the velocity sol-status must also be checked. If the sol-status is non-zero, the velocity is likely invalid. It should be noted that the receiver does not determine the direction a vessel, craft or vehicle is pointed (heading) but rather the direction of the motion of the GNSS antenna relative to the ground.

The latency of the instantaneous Doppler velocity is always 0.15 seconds. The latency represents an estimate of the delay caused by the tracking loops under acceleration of approximately 1 G. For most users, the latency can be assumed to be zero (instantaneous velocity).

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID:** 243

**Log Type:** Synch

**Recommended Input:**

```
log psrxyza ontime 1
```

**ASCII Example:**

```
#PSRXYZA, COM1, 0, 58.5, FINESTEERING, 1419, 340038.000, 02000040, 4a28, 2724;  
SOL_COMPUTED, SINGLE, -1634530.7002, -3664617.2823, 4942495.5175, 1.7971, 2.3694,

```

The instantaneous Doppler is the measured Doppler frequency which consists of the satellite's motion relative to the receiver (Satellite Doppler + User Doppler) and the clock (local oscillator) drift.

## 3.135 QZSSALMANAC

### Decoded QZSS Almanac parameters

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the decoded L1 C/A almanac parameters as received from the satellite with the parity information removed and appropriate scaling applied.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

For more information about QZSS almanac data, refer to the Interface Specifications for QZSS at <http://qzss.go.jp/en/technical/ps-is-qzss/ps-is-qzss.html>.

**Message ID:** 1346

**Log Type:** Asynch

**Recommended Input:**

```
log qzssalmanaca onchanged
```

**ASCII Example:**

```
#QZSSALMANACA,COM1,0,89.5,SATTIME,1642,148584.000,02000008,67d2,39655;1,193,1642,208896.0,7.587582e-02,-2.94869425e-09,-1.4441238e+00,-1.5737385e+00,1.7932513e+00,0.00000000,0.00000000,7.29336435e-05,4.2159360e+07,7.11809030e-01,7,7*fb648921
```

The speed at which the receiver locates and locks onto new satellites is improved if the receiver has approximate time and position (**SETAPPROXTIME** and **SETAPPROXPOS**), as well as an almanac. This allows the receiver to compute the elevation of each satellite so it can tell which satellites are visible and their Doppler offsets, improving Time to First Fix (TTFF).

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	QZSSALMANAC Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#messages	Number of satellite PRN almanac messages to follow. Set to zero until almanac data is available	Ulong	4	H
3	PRN	Satellite PRN number for current message (dimensionless)	Ulong	4	H+4
4	week	Almanac reference week	Ulong	4	H+8
5	seconds	Almanac reference time (s)	Double	8	H+12
6	ecc	Eccentricity (dimensionless)	Double	8	H+20

Field	Field Type	Description	Format	Binary Bytes	Binary Offset

## 3.136 QZSSCNAVRAWMESSAGE

### QZSS CNAV Raw Message

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log provides the raw CNAV message from signals which contain the CNAV message (L2C, L5). It also indicates whether the raw message is generated from an L2C signal or L5 signal.

The **QZSSCNAVRAWMESSAGE** log is not output by default. To receive this log, data decoding for L2C or L5 must be enabled using the **DATADECODESIGNAL** command (see page 115)

```
DATADECODESIGNAL QZSSL2CM ENABLE
```

```
DATADECODESIGNAL QZSSL5 ENABLE
```

**Message ID:** 2261

**Log Type:** Asynch

**Recommended Input:**

```
log qzsscnavrawmessagea onnew
```

**ASCII Example:**

### 3.138 QZSSIONUTC

#### *QZSS ionospheric and time information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the Ionospheric Model parameters (ION) and the Universal Time Coordinated parameters (UTC) for QZSS.

**Message ID:** 1347

**Log Type:** Asynch

**Recommended Input:**

```
log qzssionutca onchanged
```

**ASCII Example:**

```
#QZSSIONUTCA, COM1, 0, 94.0, FINESTEERING, 1642, 153300.565, 02480008, 158b, 39655;  
1.396983861923218e-08, -6.705522537231444e-8, 0.000000000000000e+000,

17	deltat lsf	Future delta time due to leap seconds	Long	4	H+100
18	Reserved			4	H+104
19	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+108
20	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.139 QZSSRAWALMANAC

#### Raw QZSS almanac data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the undecoded L1 C/A almanac subframes as received from the QZSS satellite.

**Message ID:** 1345

**Log Type:** Asynch

**Recommended Input:**

```
log qzssrawalmanaca onchanged
```

**ASCII Example:**

```
#QZSSRAWALMANACA, COM1, 0, 93.5, SATTIME, 1642, 153300.000, 02480008, 64c4, 39655;1642,
208896.000, 7,
1, 8b000031c390c1820e33d007fefe07cae831c5293ebfe15049104a000001,
51, 8b000031c613f3336a1fffffffffffffffffffffffffffffffffffffffff000000,

53, 8b000031e717f58082082082082082082082082082082082082082080
*ca4596f91
```

The OEM7 family of receivers automatically saves almanacs in their Non-Volatile Memory (NVM), therefore creating an almanac boot file is not necessary.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	QZSSRAW ALMANAC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	ref week	Almanac reference week number	Ulong	4	H
3	ref secs	Almanac reference time, in milliseconds (binary data) or seconds (ASCII data)	GPSec	4	H+4
4	#subframes	Number of subframes to follow	Ulong	4	H+8
5	svid	SV ID (satellite vehicle ID) SV ID 1 to 10 corresponds to QZSS PRN 193 to 202. Any other values indicate the page ID. Refer to QZSS Interface Specification for more details.	Hex	2	H+12
6	data	Subframe page data	Hex	30	H+14

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7		Next subframe offset = $H+12+(\#subframe \times 32)$			
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	$H+12+(\#subframes \times 32)$
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.140 QZSSRAWCNAVMESSAGE

### Raw QZSS L2C and L5 CNAV message

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides the raw QZSS L2C and L5 CNAV message.

The QZSSRAWCNAVMESSAGE log is not output by default. To receive this log, data decoding for QZSSL2C or QZSSL5 must be enabled using the **DATADCODESIGNAL** command (see page 115) for the specific signal.

**Message ID:** 1530

**Log Type:** Collection

**Recommended Input:**

```
log qzssrawcnavmessage onnew
```

**ASCII Example:**

```
#QZSSRAWCNAVMESSAGEA,COM1,0,66.5,SATTIME,1902,405696.000,02000020,20f7,13677;40,193,10,8b04a84110edc2a346a97d311c3ff854620220004eba94f1313134f005530056c9da0cc c2300*1f2abac5
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	QZSSRAWCNAVMESSAGE header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	signal channel	Signal channel providing the bits	Ulong	4	H
3	PRN	QZSS satellite PRN number	Ulong	4	H+4
4	message ID	CNAV message ID	Ulong	4	H+8
5	data	CNAV raw message data	Hex [38]	38	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+50
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.141 QZSSRAWEPHEM

#### QZSS Raw ephemeris information

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw binary information for subframes one, two and three from the satellite with the parity information removed. Each subframe is 240 bits long (10 words - 24 bits each) and the log contains a total 720 bits (90 bytes) of information (240 bits x 3 subframes). This information is preceded by the PRN number of the satellite from which it originated. This message is not generated unless all 10 words from all 3 frames have passed parity.

**Message ID:** 1331

**Log Type:** Asynch

**Recommended Input:**

```
log qzssrawephema onnew
```

**ASCII Example:**

```
#QZSSRAWEPHEMA, COM1, 0, 84.5, SATTIME, 1642, 230580.000, 02000008, 2f9e, 39655;193,
1642, 234000, 8b00004b0f879aa01c8000000000000000000000000f6df3921fe0005ffffdbd,
8b00004b1009dfd2bb1ec493a98277e8fd26d924d5062dcae8f5b739210e,
8b00004b108ffe5bc52864ae00591d003b8b02b6bfe13f3affe2afdf1e7*d2bd151e
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	QZSSRAWEPHEM header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Satellite PRN number	Ulong	4	H
3	ref week	Ephemeris reference week number	Ulong	4	H+4
4	ref secs	Ephemeris reference time (s)	Ulong	4	H+8
5	subframe1	Subframe 1 data	Hex	30	H+12
6	subframe2	Subframe 2 data	Hex	30	H+42
7	subframe3	Subframe 3 data	Hex	30	H+72
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+102
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.142 QZSSRAWSUBFRAME

### Raw QZSS subframe data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw QZSS subframe data.

A raw QZSS subframe is 300 bits in total, 10 words of 30 bits each. This includes the parity 6 bits at the end of each word, for a total of 60 parity bits. Note that in Field #4, the 'data' field below, the 60 parity bits are stripped out and only the raw subframe data remains, for a total of 240 bits. There are two bytes added onto the end of this 30 byte packed binary array to pad out the entire data structure to 32 bytes in order to maintain 4 byte alignment.

**Message ID:** 1330

**Log Type:** Asynch

**Recommended Input:**

```
log qzssrawsubframea onnew
```

**ASCII Example:**

```
#QZSSRAWSUBFRAMEA,COM1,0,85.5,SATTIME,1642,230604.000,02000008,e56b,39655;193,5,8b00004b11970637984efbf7fd4d0fa10ca49631ace140740a08fe0dfd43,65*6a7b9123
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	QZSSRAW SUBFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PRN	Satellite PRN number	Ulong	4	H
3	subframe ID	Subframe ID	Ulong	4	H+4
4	data	Raw subframe data	Hex [30]	32 <sup>1</sup>	H+8
5	chan	Signal channel number that the frame was decoded on	Ulong	4	H+40
6	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
7	[CR][LF]	Sentence terminator	-	-	-

<sup>1</sup>In the binary log case, an additional 2 bytes of padding are added to maintain 4-byte alignment.

## 3.143 RAIMSTATUS

### *RAIM status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides information on Receiver Autonomous Integrity Monitoring (RAIM) status (refer to the **RAIMMODE** command on page 278).

**Message ID:** 1286

**Log Type:** Synch

**Recommended Input:**

```
log raimstatusa ontime 1
```

**ASCII Example:**

```
#RAIMSTATUSA,COM1,0,88.5,FINESTEERING,1837,268443.500,02040008,bf2d,32768;DEFAU  
LT,PASS,NOT_AVAILABLE,0.000,NOT_AVAILABLE,0.000,1,GLONASS,10-7*6504be7b
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RAIMSTATUS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	RAIM Mode	RAIM mode (refer to <i>Table 146: RAIM Mode Types</i> on the next page)	Enum	4	H
3	Integrity status	Integrity Status (see <i>Table 147: Integrity Status</i> on the next page)	Enum	4	H+4
4	HPL status	Horizontal protection level status (see <i>Table 148: Protection Level Status</i> on page 700)	Enum	4	H+8
5	HPL	Horizontal protection level (m)	Double	8	H+12
6	VPL status	Vertical protection level status (see <i>Table 148: Protection Level Status</i> on page 700)	Enum	4	H+20
7	VPL	Vertical protection level (m)	Double	8	H+24
8	#SVs	Number of excluded satellites	Ulong	4	H+32
9	System	Satellite system (see <i>Table 118: Satellite System</i> on page 561)	Enum	4	H+36

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
10	Satellite ID	In binary logs, the satellite ID field is 4 bytes. The 2 lowest order bytes, interpreted as a USHORT, are the system identifier. For instance, the PRN for GPS or the slot for GLONASS. The 2 highest-order bytes are the frequency channel for GLONASS, interpreted as a SHORT and zero for all other systems.  In ASCII and abbreviated ASCII logs, the satellite ID field is the system identifier. If the system is GLONASS and the frequency channel is not zero, then the signed channel is appended to the system identifier. For example, slot 13, frequency channel -2 is output as 13-2.	Ulong	4	H+40
11	Next offset field = H+36+(#SVs * 8)				
12	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+36 + (#SVs * 8)
13	[CR][LF]	Sentence terminator (ASCII only)			

Table 146: RAIM Mode Types

Binary	ASCII	Description
0	DISABLE	Do not do integrity monitoring of least squares solution
1	USER	User will specify alert limits and probability of false alert
2	DEFAULT	Use NovAtel RAIM (default)
3	APPROACH	Default numbers for non-precision approach navigation modes are used - HAL = 556 m (0.3 nm), VAL = 50 m for LNAV/VNAV
4	TERMINAL	Default numbers for terminal navigation mode are used - HAL = 1 nm, no VAL requirement
5	ENROUTE	Default numbers for enroute navigation mode are used - HAL = 2 nm, no VAL requirement

Table 147: Integrity Status

Binary	ASCII	Description
0	NOT_AVAILABLE	RAIM is unavailable because either there is no solution or because the solution is unique, that is, there is no redundancy
1	PASS	RAIM succeeded. Either there were no bad observations or the bad observations were successfully removed from the solution
2	FAIL	RAIM detected a failure and was unable to isolate the bad observations

Table 148: Protection Level Status

Binary	ASCII	Description
0	NOT_AVAILABLE	When RAIM is not available. For example, immediately after issuing a <b>FRESET</b> command (see page 171) or when there are not enough satellites tracked to have the required redundant observations.
1	PASS	Current protection levels are below alert limits, meaning positioning accuracy requirements are fulfilled. HPL < HAL VPL < VAL
2	ALERT	Current protection levels are above alert limits, meaning required positioning accuracy cannot be guaranteed by RAIM algorithm. HPL ≥ HAL VPL ≥ VAL

## 3.144 RANGE

### *Satellite range information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The RANGE log contains the channel measurements for the currently tracked satellites. When using this log, please keep in mind the constraints noted along with the description.

It is important to ensure that the receiver clock has been set. This can be monitored by the bits in the Receiver Status field of the log header. Large jumps in pseudorange as well as Accumulated Doppler Range (ADR) occur as the clock is being adjusted. If the ADR measurement is being used in precise phase processing, it is important not to use the ADR if the "parity known" flag, in the ch-tr-status field, is not set as there may exist a half (1/2) cycle ambiguity on the measurement. The tracking error estimate of the pseudorange and carrier phase (ADR) is the thermal noise of the receiver tracking loops only. It does not account for possible multipath errors or atmospheric delays.

If multiple signals are being tracked for a given PRN, an entry for each signal, with the same PRN, appears in the RANGE logs. As shown in *Table 149: Channel Tracking Status* on page 704, these entries can be differentiated by bits 21-25, which indicate the signal type of the observation.

For dual antenna receivers, a RANGE\_1 log can be requested to get RANGE data from the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the log is from the second antenna. To request an ASCII log enter RANGEA\_1, and for a binary log enter RANGEB\_1.

**Message ID:** 43

**Log Type:** Synch

**Recommended Input:**

```
log rangea ontime 30
```

**Abbreviated ASCII Example:**

3	Narrow frequency band pull-in
4	Phase lock loop
6	Channel steering
7	Frequency lock loop
9	Channel alignment
10	Code search
11	Aided phase lock loop
23	Side peak detection
24	FFT sky search

Table 151: Correlator Type

State	Description
0	N/A

<sup>1</sup>This bit is zero until the parity is known and the parity known flag (bit 11) is set to 1.

After a loss of lock, there is a half cycle ambiguity on the ADR (carrier phase) until enough navigation data has been decoded to determine the correct phase of the carrier. At the point this is determined, the "parity known" and "half cycle added" flags will get set. If the half cycle flag is set to 1, it indicates that a half cycle was added to the ADR to correct an inverted phase.

<sup>2</sup>A PRN can be locked out using the **LOCKOUT** command.

State	Description
1	Standard correlator: spacing = 1 chip
2	Narrow correlator: spacing < 1 chip
3	Reserved
4	Pulse Aperture Correlator (PAC)
5	Narrow PAC
6	Reserved

## 3.145 RANGECMP

### *Compressed version of the RANGE log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the RANGE data in a compressed format.

For dual antenna receivers, a RANGECMP\_1 log can be requested to get RANGECMP data from the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the log is from the second antenna. To request an ASCII log enter RANGECMPA\_1, and for a binary log enter RANGECMPB\_1.

**Message ID:** 140

**Log Type:** Synch

**Recommended Input:**

```
log rangecmpa ontime 10
```

**ASCII Example:**

```
#RANGECMPA, COM1, 0, 63.5, FINESTEERING, 1429, 226780.000, 02000000, 9691, 2748;

## 3.146 RANGEEMP2

### *Compressed version of the RANGE log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the RANGE data in a compressed format to handle more channels and different channel types than the RANGEEMP log.

For dual antenna receivers, a RANGEEMP2\_1 log can be requested to get RANGEEMP2 data from the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the log is from the second antenna. To request an ASCII log enter RANGEEMP2A\_1, and for a binary log enter RANGEEMP2B\_1.

**Message ID:** 1273

**Log Type:** Synch

**Recommended Input:**

```
log rangemp2a ontime 10
```

**Example:**

```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RANGEEMP2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
2	# bytes	Number of bytes in the compressed binary range data <sup>1</sup>	Uchar	4	H
3	RangeData	Compressed binary range data in the format of <i>Table 155: Satellite Block of the Range Record Format (RANGECMP2 only)</i> below and <i>Table 156: Signal Block of the Range Record Format (RANGECMP2 only)</i> on the next page <sup>2</sup>	Uchar	#bytes	H+4
4	xxxx	32-bit CRC (ASCII and binary only)	Hex	4	H+4+ (# bytes)
5	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 155: Satellite Block of the Range Record Format (RANGECMP2 only)**

Data	Description	Bits first to last	Length (bits)	Scale Factor	Units
SV Channel Number	Receiver SV channel number	0-7	8	-	-
Satellite Identifier	Satellite identifier specific to the satellite system Refer to <i>PRN Numbers</i> on page 48	8-15	8	-	-
GLONASS Frequency Identifier	GLONASS frequency channel offset by +7	16-19	4	(7+Ch#)	-
Satellite System Identifier	Defined in <i>Table 118: Satellite System</i> on page 561	20-24	5	-	Enum
Reserved		25	1	-	-
Pseudorange Base	Pseudorange base value to be combined with PSR Diff and Phaserange Diff in each following Signal Block	26-54	29	1	m
Doppler Base	Doppler base value to be combined with the Scaled Doppler Diff value in each following Signal Block	55-75	21	1	Hz
Number of Signal Blocks	The number of Signal Blocks to follow this Satellite Block. See <i>Table 156: Signal Block of the Range Record Format (RANGECMP2 only)</i> below for Signal Block definition	76-79	4	-	-

<sup>1</sup>Maximum is 2880 bytes for 120 channels; maximum 5760 for 240 channels.

<sup>2</sup>The compressed binary range data is organized into satellite blocks, one for each satellite. Each satellite block is followed by a variable number of signal blocks corresponding to the same satellite. For example, a Satellite Block for GPS PRN 17 may be followed by two Signal Blocks for the L1 C/A and L2C signals.

**Table 156: Signal Block of the Range Record Format (RANGECMP2 only)**

Data	Description	Bits first to last	Length (bits)	Scale Factor	Units
Signal Type	Defined in <i>Table 160: Signal Type (only in RANGECMP2)</i> on page 719	0-4	5	-	Enum
Phase Lock	Phase Lock: 0 = Not locked, 1 = Locked	5	1	-	Bool
Parity Known	Parity Known: 0 = Not known, 1 = Known	6	1	-	Bool
Code Lock	Code Lock: 0 = Not locked, 1 = Locked	7	1	-	Bool
Locktime	Time of continuous tracking with no cycle slips. The locktime value saturates at a maximum of 131071 ms	8-24	17	1	ms
Correlator Type	Correlator type: (see <i>Table 151: Correlator Type</i> on page 706)	25-28	4	-	Enum
Primary Signal	Primary signal: 0 = Not primary, 1 = Primary	29	1	-	Bool
Carrier Phase Measurement	Carrier phase measurement: 0 = Half cycle not added, 1 = Half cycle added	30	1	-	Bool
Reserved		31	1	-	-
C/No	Carrier to Noise density ratio	32-36	5	(20 + n)	dB-Hz
StdDev PSR	Pseudorange Standard Deviation (defined <i>Table 157: Std Dev PSR Scaling</i> on the next page)	37-40	4	Bit Field in <i>Table 157: Std Dev PSR Scaling</i> on the next page	-
StdDev ADR	Carrier-Phase Standard Deviation (defined <i>Table 158: Std Dev ADR Scaling</i> on page 717)	41-44	4	Bit Field in <i>Table 158: Std Dev ADR Scaling</i> on page 717	-
PSR Diff	Pseudorange Diff to be combined with Pseudorange base i.e., PSR = PSRBase + PSRDiff/128	45-58	14	1/128	m (unsigned)
Phaserange Diff	Phaserange Diff to be combined with Pseudorange Base i.e., ADR = PSRBase + PhaserangeDiff/2048	59-78	20	1/2048	m (unsigned)

Data	Description	Bits first to last	Length (bits)	Scale Factor	Units
Scaled Doppler Diff <sup>1</sup>	Doppler Diff to be combined with Doppler Base. Note that all Doppler values are scaled to the L1/E1 equivalent value. (refer to <i>Table 159: L1/E1/B1 Scaling</i> on the next page) i.e., Doppler = (DopplerBase + ScaledDopplerDiff/256)/L1ScaleFactor	79-95	17	1/256	Hz (signed)

Table 157: Std Dev PSR Scaling

PSR Std Dev Bit Field Value	Represented Std Dev (m)
0	0.02
1	0.03
2	0.045
3	0.066
4	0.099
5	0.148
6	0.22
7	0.329
8	0.491

## 3.147 RANGEEMP4

### *Highly compressed version of the RANGE log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the RANGE data in a more heavily compressed format compared to the RANGEEMP2 log.

For dual antenna receivers, a RANGEEMP4\_1 log can be requested to get RANGEEMP4 data from the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the log is from the second antenna. To request an ASCII log enter RANGEEMP4A\_1, and for a binary log enter RANGEEMP4B\_1.

1. Channels that have been manually assigned to a PRN with **ASSIGN** or **ASSIGNALL** are not reported in the **RANGEEMP4** log.
2. L-Band channels are not reported in the **RANGEEMP4** log.
3. **RANGEEMP4** is a complex log. For more information about decoding the **RANGEEMP4** log, refer to *Example of Bit Parsing a RANGEEMP4 Log* on page 1060.

**Message ID:** 2050

**Log Type:** Synth

**Recommended Input:**

```
log rangemp4a ontime 10
```

**Example:**

```

Ref Data Block ID	0... 7	<p>This ID identifies to which reference data the Differential Data is linked. This value is incremented by 1 each time a new Reference Measurement Block is used.</p>	3	1

Data Name	Range	Description	Bits	Scale Factor
GLONASS Frequency Number	0... 20 (-7 to +13)	<p>These bits are only present for GLONASS satellites in the Reference Data. This represents the GLONASS Frequency Number which identifies the frequency offset of the carrier frequency. The value will appear as a number between 0 and 20 which directly translates into a frequency offset number between -7 to +13.</p> <p>If the GLONASS Slot ID is unknown, a temporary Slot ID for this satellite will be set between 43 and 63 based on the GLONASS Frequency Number: PRN = 63 – GLONASS Frequency Number</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  The GLONASS Frequency Number used in this calculation is the 0 to 20 value, not the adjusted -7 to +13 value. </div>	5	1
Bit Sum:			4 (Non-GLONASS)	9 (GLONASS)
<div style="border: 1px solid black; padding: 5px;">  This block is sent once for each bit set to 1 in the Satellites field found in <i>Table 162: Satellite and Signal Block</i> on page 723. </div>				

Table 164: Primary Reference Signal Measurement Block

Data Name	Range	Description	Bits	Scale Factor
Parity Flag	0... 1	0 = Parity Unknown 1 = Parity Known	1	1
½ Cycle Flag	0... 1	0 = Half Cycle Not Added 1 = Half Cycle Added	1	1
C/No	0... 63.95	C/No	11	0.05 dBHz
Lock Time	0... 15	The Lock Time – See <i>Table 169: Lock Time</i> on page 730	4	1
Pseudorange Std Dev	0... 15	The Pseudorange Standard Deviation (m) – See <i>Table 171: Pseudorange Std Dev</i> on page 732	4	
ADR Std Dev	0... 15	The ADR Standard Deviation (cycles) – See <i>Table 170: ADR Std Dev</i> on page 731	4	

Data Name	Range	Description	Bits	Scale Factor
Primary Pseudorange	0... 68719476.74	The Pseudo Range of the 1st signal (Signals field in <i>Table 162: Satellite and Signal Block</i> on page 723). If this value equals $(2^{37}-1) = 137438953471$ , it represents a signal that is not locked.	37	0.0005 m
PhaseRange – Primary Pseudorange	±419.4303	(2's Complement) If this value equals $-(2^{23}-1) = -4194304$ , it represents the signal is not locked.	23	0.0001 m
Primary Doppler	±3355.4431	(2's Complement) If this value equals $-(2^{26}-1) = -33554432$ , it represents an invalid Doppler.	26	0.0001 m/s
Bit Sum:			111	
<div style="border: 1px solid black; padding: 10px; margin-bottom: 10px;">  This block is sent once for the first bit set to 1 in the Included Signals field found in <i>Table 162: Satellite and Signal Block</i> on page 723. For any bits set to 1 after the first bit set to 1, refer to <i>Table 165: Secondary Reference Signals Measurement Block</i> below.         </div> <div style="border: 1px solid black; padding: 10px;">  This table is for Reference blocks only, as indicated by the Data Format Flag (see <i>Table 163: Measurement Block Header</i> on page 724).         </div>				

Table 165: Secondary Reference Signals Measurement Block

Data Name	Range	Description	Bits	Scale Factor
Parity Flag	0... 1	0 = Parity Unknown 1 = Parity Known	1	1
½ Cycle Flag	0... 1	0 = Half Cycle Not Added 1 = Half Cycle Added	1	1
C/No Indicator	0... 63.95	C/No	11	0.05 dBHz
Lock Time	0... 15	The Lock Time – See <i>Table 169: Lock Time</i> on page 730	4	1
Pseudorange Std Dev	0... 15	The Pseudorange Standard Deviation (m) – See <i>Table 171: Pseudorange Std Dev</i> on page 732	4	

Data Name	Range	Description	Bits	Scale Factor
ADR Std Dev	0... 15	The ADR Standard Deviation (cycles) – See <i>Table 170: ADR Std Dev</i> on page 731	4	
Pseudorange – Primary Signal Pseudorange	$\pm 262.1435$	(2's Complement) If this value equals $-(2^{20}-1) = -524288$ , it indicates the signal is not locked.	20	0.0005 m
Phaserange – Pseudorange	$\pm 419.4303$	(2's Complement) If this value equals $-(2^{23}-1) = -4194304$ , it indicates the signal is not locked.	23	0.0001 m
Doppler – Primary Doppler	$\pm 0.8191$	(2's Complement) If this value equals $-(2^{14}-1) = -8192$ , it indicates an invalid Doppler.	14	0.0001 m/s
Bit Sum:			82	

 This block is sent once for each bit set to 1 after the first bit set to 1 in the Included Signals field found in *Table 162: Satellite and Signal Block* on page 723.

 This table is for Reference blocks only, as indicated by the Data Format Flag (see *Table 163: Measurement Block Header* on page 724).

Table 166: Primary Differential Signal Measurement Block

Data Name	Range	Description	Bits	Scale Factor
Parity Flag	0... 1	0 = Parity Unknown 1 = Parity Known	1	1
½ Cycle Flag	0... 1	0 = Half Cycle Not Added 1 = Half Cycle Added	1	1
C/No	0... 63.95	C/No	11	0.05 dBHz
Lock Time	0... 15	The Lock Time – See <i>Table 169: Lock Time</i> on page 730	4	1
Pseudorange Std Dev	0... 15	The Pseudorange Standard Deviation (m) – See <i>Table 171: Pseudorange Std Dev</i> on page 732	4	
ADR Std Dev	0... 15	The ADR Standard Deviation (cycles) – See <i>Table 170: ADR Std Dev</i> on page 731	4	

Data Name	Range	Description	Bits	Scale Factor
Pseudorange – Predicted Pseudorange	$\pm 131.0715$	(2's Complement) If this value equals $-(2^{19}-1) = -262144$ , it indicates a signal that is not locked.  The Predicted Pseudorange = reference pseudorange plus (the reference doppler x time difference between the reference log and the differential log). The Reference log and Differential logs used must contain matching Ref Data Block ID references ( <i>Table 163: Measurement Block Header on page 724</i> ).	19	0.0005 m
Phaserange – Predicted Phaserange	$\pm 3.2767$	(2's Complement) If this value equals $-(2^{16}-1) = -32768$ , it indicates the signal is not locked.  The Predicted Phaserange = reference phaserange plus (the reference doppler x time difference between the reference log and the differential log). The Reference log and Differential logs used must contain matching Ref Data Block ID references ( <i>Table 163: Measurement Block Header on page 724</i> ).	16	0.0001 m
Doppler – Reference Doppler	$\pm 13.1071$	(2's Complement) If this value equals $-(2^{18}-1) = -131072$ , it indicates an invalid Doppler.  The Reference Doppler is the Doppler for that PRN and for that signal from the Reference log. The Reference log and Differential logs used must contain matching Ref Data Block ID references ( <i>Table 163: Measurement Block Header on page 724</i> ).	18	0.0001 m/s
Bit Sum:			78	
<div style="border: 1px solid black; padding: 10px; margin-bottom: 10px;">  This block is sent once for each bit set to 1 after the first bit set to 1 in the Included Signals field found in <i>Table 162: Satellite and Signal Block on page 723</i>. ## 3.148 RANGEGPSL1

### *L1 version of the RANGE log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log is identical to the **RANGE** log (see page 701) except that it only includes GPS L1 C/A observations.

**Message ID:** 631

**Log Type:** Synch

**Recommended Input:**

```
log rangegpsl1a ontime 30
```

**ASCII Example:**

```
#RANGEGPSL1A,COM1,0,57.0,FINESTEERING,1337,404766.000,02000000,5862,1984;

```

Since the RANGEGPSL1 log includes only GPS L1 C/A observations, it is smaller in size than the RANGE log which contains entries for multiple systems and signals. Use the RANGEGPSL1 log when data throughput is limited and you are only interested in GPS L1 C/A range data. For GPS L1 only models, RANGE and RANGEGPSL1 logs are identical.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RANGEGPSL1 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	# obs	Number of L1 observations with information to follow	Long	4	H
3	PRN	Satellite PRN number of range measurement (1-32)	Ushort	2	H+4
4	Reserved		Ushort	2	H+6
5	psr	Pseudorange measurement (m)	Double	8	H+8
6	psr std	Pseudorange measurement standard deviation (m)	Float	4	H+16
7	adr	Carrier phase, in cycles (accumulated Doppler range)	Double	8	H+20
8	adr std	Estimated carrier phase standard deviation (cycles)	Float	4	H+28
9	dopp	Instantaneous carrier Doppler frequency (Hz)	Float	4	H+32
10	C/No	Carrier to noise density ratio C/No = $10[\log_{10}(S/N_0)]$ (dB-Hz)	Float	4	H+36
11	locktime	Number of seconds of continuous tracking (no cycle slipping)	Float	4	H+40
12	ch-tr-status	Tracking status (see <i>Table 149: Channel Tracking Status</i> on page 704)	Ulong	4	H+44
13...	Next PRN offset = $H + 4 + (\#obs \times 44)$				
14	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#obs x 44)
15	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.149 RAWALM

### Raw GPS L1 C/A Almanac data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the undecoded GPS almanac subframes as received from the satellite. For more information about Almanac data, refer to *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).

**Message ID:** 74

**Log Type:** Asynch

**Recommended Input:**

```
log rawalma onchanged
```

**ASCII Example:**

```
#RAWALMA, COM1, 0, 56.0, SATTIME, 1337, 405078.000, 02000000, cc1b, 1984; 1337, 589824.000, 43,

```

The OEM7 family of receivers automatically saves almanacs in their Non-Volatile Memory (NVM), therefore creating an almanac boot file is not necessary.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWALM header	Log header. See <i>Messages</i> on page 30 for more information.		H	0

## 3.150 RAWCNAVFRAME

### Raw GPS CNAV frame data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides raw frame data from signals which contain the CNAV message (L2C, L5).

The RAWCNAVFRAME log is not output by default. To receive this log, data decoding for L2C or L5 must be enabled using the **DATADECODESIGNAL** command (see page 115) for the specific signal.

**Message ID:** 1066

**Log Type:** Asynch

**Recommended Input:**

```
log rawcnavframea onnew
```

**ASCII Example:**

```
#RAWCNAVFRAMEA, COM1, 0, 63.0, SATTIME, 1902, 431718.000, 02000020, ee56, 13677;17, 6, 11, 8b18b8c892cd499a403d89d3a5bfc05f500a1ffff6007dff412e017a3c029ccff5d6001fc9a70*0d ddab32
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWCNAVFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	signal channel	Signal channel providing the bits	Ulong	4	H
3	PRN	Satellite PRN number	Ulong	4	H+4
4	frame ID	frame ID	Ulong	4	H+8
5	data	Raw frame data	Hex [38]	38	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+50
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.151 RAWEPHEM

### *Raw GPS L1 C/A ephemeris*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw binary information for subframes one, two and three from the GPS satellite L1 C/A signal with the parity information removed. Each subframe is 240 bits long (10 words - 24 bits each) and the log contains a total 720 bits (90 bytes) of information (240 bits x 3 subframes). This information is preceded by the PRN number of the satellite from which it originated. This message is not generated unless all 10 words from all 3 frames have passed parity.

Ephemeris data whose Time of Ephemeris (TOE) is older than six hours is not shown. Multiple logs are output, one for each GPS satellite with collected ephemeris information.

**Message ID:** 41

**Log Type:** Asynch

**Recommended Input:**

```
log rawephema onnew
```

**ASCII Example:**

```

```

A way to use only one receiver and achieve better than 1 meter accuracy is to use precise orbit and clock files. Three types of GPS ephemeris, clock and earth orientation solutions are compiled by an elaborate network of GNSS receivers around the world all monitoring the satellite characteristics. IGS rapid orbit data is processed to produce files that correct the satellite clock and orbit parameters. Since there is extensive processing involved, these files are available on a delayed schedule from the US National Geodetic Survey at: [www.ngs.noaa.gov/orbits](http://www.ngs.noaa.gov/orbits)

Precise ephemeris files are available today to correct GPS data which was collected a few days ago. All you need is one GNSS receiver and a computer to process on. Replace the ephemeris data with the precise ephemeris data and post-process to correct range values.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWEPHEM header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PRN	Satellite PRN number	Ulong	4	H
3	ref week	Ephemeris reference week number	Ulong	4	H+4
4	ref secs	Ephemeris reference time (s)	Ulong	4	H+8
5	subframe1	Subframe 1 data	Hex [30]	30	H+12
6	subframe2	Subframe 2 data	Hex [30]	30	H+42
7	subframe3	Subframe 3 data	Hex [30]	30	H+72
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+102
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.152 RAWGPSSUBFRAME

### Raw GPS L1 C/A subframe data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw GPS L1 C/A subframe data.

A raw GPS L1 C/A subframe is 300 bits in total. This includes the parity bits which are interspersed with the raw data ten times in six bit chunks, for a total of 60 parity bits. Note Field #5, below, has these 60 parity bits stripped out and only the raw subframe data remains, for a total of 240 bits.

**Message ID:** 25

**Log Type:** Asynch

**Recommended Input:**

```
log rawgpssubframea onnew
```

**ASCII Example:**

```
#RAWGPSSUBFRAMEA,COM1,59,62.5,SATTIME,1337,405348.000,02000000,f690,1984;2,22,4,8b04e483f3b17ee037a3732fe0fc8ccf074303ebdf2f6505f5aaaaaaaaa9,2*41e768e4
...
#RAWGPSSUBFRAMEA,COM1,35,62.5,SATTIME,1337,405576.000,02000000,f690,1984;4,25,2,8b04e48406a8b9fe8b364d786ee827ff2f062258840ea4a10e20b964327e,4*52d460a7
...
#RAWGPSSUBFRAMEA,COM1,0,62.5,SATTIME,1337,400632.000,02000000,f690,1984;20,9,3,8b04e4826aadff3557257871000a26fc34a31d7a300bede5ffa3de7e06af,20*55d16a4a
```

The RAWGPSSUBFRAME log can be used to receive the data bits with the parity bits stripped out. Alternately, you can use the **RAWGPSWORD** log (see page 742) to receive the parity bits in addition to the data bits.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWGPSSUBFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	decode #	Frame decoder number	Long	4	H
3	PRN	Satellite PRN number	Ulong	4	H+4
4	subframe id	Subframe ID	Ulong	4	H+8
5	data	Raw subframe data	Hex [30]	32 <sup>1</sup>	H+12

<sup>1</sup>In the binary log case, an additional 2 bytes of padding are added to maintain 4-byte alignment.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
6	signal channel	Signal channel number that the frame was decoded on	Ulong	4	H+44
7	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+48
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.153 RAWGPSWORD

#### *Raw GPS L1 C/A navigation word*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This message contains the framed GPS L1 C/A raw navigation words. Each log contains a new 30 bit navigation word (in the least significant 30 bits), plus the last 2 bits of the previous word (in the most significant 2 bits). The 30 bit navigation word contains 24 bits of data plus 6 bits of parity. The GPS reference time stamp in the log header is the time the first bit of the 30 bit navigation word was received. Only navigation data that has passed parity checking appears in this log. One log appears for each PRN being tracked every 0.6 seconds if logged ONNEW or ONCHANGED.

**Message ID:** 407

**Log Type:** Asynch

**Recommended Input:**

```
log rawgpsworda onnew
```

**ASCII Example:**

```
#RAWGPSWORDA,COM1,0,58.5,FINESTEERING,1337,405704.473,02000000,9b16,1984;14,7ff9f5dc*8e7b8721
```

...

```
#RAWGPSWORDA,COM1,0,57.0,FINESTEERING,1337,405783.068,02000000,9b16,1984;1,93fef8a*6dd62c81
```

...

```
#RAWGPSWORDA,COM1,0,55.5,FINESTEERING,1337,405784.882,02000000,9b16,1984;5,fffff8ce*a948b4de
```

The RAWGPSWORD log can be used to receive the parity bits in addition to the data bits. Alternately, you can use the RAWGPSSUBFRAME log which already has the parity bits stripped out

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWGPSWORD header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PRN	Satellite PRN number	Ulong	4	H
3	nav word	Raw navigation word	Hex[4]	4	H+4
4	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+8
5	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.154 RAWSBASFRAME

### Raw SBAS frame data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw SBAS frame data of 226 bits (8-bit preamble, 6-bit message type and 212 bits of data but without a 24-bit CRC). Only frame data with a valid preamble and CRC are reported.

**Message ID:** 973

**Log Type:** Asynch

**Recommended Input:**

```
log rawsbasframea onnew
```

**ASCII Example:**

```
#RAWSBASFRAMEA, COM1, 0, 91.0, SATTIME, 1610, 341534.000, 02000000, 58e4, 38637; 32, 133, 4,
, c6115ffc00000c009ffc07004c089ffdfdfdfdfdfdf957bbb6bffffc0, 32*5afc5f95
#RAWSBASFRAMEA, COM1, 0, 91.0, SATTIME, 1610, 341535.000, 02000000, 58e4, 38637; 32, 133, 2,
, 53084007ff9fffffc03002c0000f0009ffc004005ffd6b961e39b9fb80, 32*db5dfa62
#RAWSBASFRAMEA, COM1, 0, 91.0, SATTIME, 1610, 341535.000, 02000000, 58e4, 38637; 35, 135, 2,
, 53084007ff9fffffc03002c0000f0009ffc004005ffd6b961e39b9fb80, 35*b72ff2a0
...
#RAWSBASFRAMEA, COM1, 0, 90.0, SATTIME, 1610, 341539.000, 02000000, 58e4, 38637; 34, 138, 3,
, 9a0c400009ffc009ffdfdfc007fb9ffdfdfc0000040315b9bb96fb95680, 34*cb050361
```

The RAWSBASFRAME log output contains all the raw data required for an application to compute its own SBAS correction parameters.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RAWSBASFRAME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	decode #	Frame decoder number	Ulong	4	H
3	PRN	SBAS satellite PRN number	Ulong	4	H+4
4	SBAS frame ID	SBAS frame ID	Ulong	4	H+8
5	raw frame data	Raw SBAS frame data. There are 226 bits of data and 6 bits of padding.	Hex [29]	32 <sup>1</sup>	H+12

<sup>1</sup>In the binary log case, an additional 3 bytes of padding are added to maintain 4-byte alignment.

---

Field	Field type	Description	Format	Binary Bytes	Binary Offset
6	signal channel	Signal channel number that the frame was decoded on.	Ulong	4	H+44
7	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+48
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.155 RAWSBASFRAME2

### Raw SBAS frame data 2

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the raw SBAS frame data of 226 bits (8-bit preamble, 6-bit message type and 212 bits of data but without a 24-bit CRC). It also contains the transmitted frequency. Only frame data with a valid preamble and CRC are reported.

**Message ID:** 2185

**Log Type:** Asynch

**Recommended Input:**

```
log rawsbasframe2a onnew
```

**ASCII Example:**

```
#RAWSBASFRAME2A,COM1,0,77.5,SATTIME,1977,514394.000,02000020,b39f,32768;135,209,2,1,0,3,c60d4009ffc018001ffc005ffdfbf9ffc00bfed79db9bb95b9540*9a75ce69
#RAWSBASFRAME2A,COM1,0,77.5,SATTIME,1977,514394.000,02000020,b39f,32768;138,207,2,1,0,4,c6125ffdfc005fffffbfe3fb9ffdfdfdfdfdfba3956abfffc0*9324a574
#RAWSBASFRAME2A,COM1,0,77.5,SATTIME,1977,514395.000,02000020,b39f,32768;135,208,1,0,0,4,53125ffdfc011ffc000007fe3fb5ffdfdfdfdfdfba3956abfffc0*69490ac5
#RAWSBASFRAME2A,COM1,0,78.5,SATTIME,1977,514395.000,02000020,b39f,32768;138,206,1,0,0,3,530c7ff9ffc017ff9ffff9ffdfbfedffc003fe579db9bb95b9540*c7ca1531
```

The **RAWSBASFRAME2** log output contains all the raw data required for an application to compute its own SBAS correction parameters.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RAWSBASFRAME2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PRN	SBAS satellite PRN number	Ulong	4	H
3	signal channel	Signal channel number that the frame was decoded on	Ulong	4	H+4
4	SBAS Signal Source	Identifies the source of the SBAS signal: 1 – SBASL1CA 2 – SBASL5I	Uchar	1	H+8

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
5	SBAS Preamble Type	Identifies what preamble was used when tracking the SBAS signal: 0 – SBASL1CA 8-bit Preamble 1 – SBASL5I 8-bit Preamble	Uchar	1	H+9
6	Reserved		Ushort	2	H+10
7	SBAS frame ID	SBAS frame ID	Ulong	4	H+12
8	data	Raw SBAS frame data. There are 226 bits of data and 6 bits of padding.	Hex [29]	32 <sup>1</sup>	H+16
9	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+48
10	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

---

<sup>1</sup>In the binary log case, an additional 3 bytes of padding are added to maintain 4-byte alignment.

## 3.156 REFSTATION

### *Base station position and health*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the ECEF Cartesian position of the base station as received through the RTCMV3 message. It also features a time tag, the health status of the base station and the station ID. This information is set at the base station using the **FIX** command (see page 160) and the **DGPSTXID** command (see page 124). See *Figure 12: The WGS84 ECEF Coordinate System* on page 448 for a definition of the ECEF coordinates.

The base station health, Field #6, may be one of 8 values (0 to 7). Values 0 through 5 indicate the scale factor that is multiplied with the satellite UDRE one-sigma differential error values. Below are values 0 to 5 and their corresponding UDRE scale factors:

0: 1 (Health OK) 0.75 2: 0.5 3: 0.3 4: 0.2 5: 0.1

The base station health field only applies to RTCM base stations. A value of 6 means the base station transmission is not monitored and a value of 7 means that the base station is not working.

**Message ID:** 175

**Log Type:** Asynch

**Recommended Input:**

```
log refstationa onchanged
```

**ASCII Example:**

```
#REFSTATIONA, COM1, 0, 66.5, FINESTEERING, 1364, 490401.124, 82000000, 4e46, 2310; 00000000, -1634532.443, -3664608.907, 4942482.713, 0, RTCMV3, "AAAA"*1e2a0508
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	REFSTATION header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	status	Status of the base station information (see <i>Table 172: Base Station Status</i> on the next page)	Ulong	4	H
3	x	ECEF X value (m)	Double	8	H+4
4	y	ECEF Y value (m)	Double	8	H+12
5	z	ECEF Z value (m)	Double	8	H+20
6	health	Base station health, see the description at the start of this section	Ulong	4	H+28
7	stn type	Station type (see <i>Table 173: Base Station Type</i> on the next page)	Enum	4	H+32

Field	Field type	Description	Format	Binary Bytes	Binary Offset
8	stn ID	Base station ID	Char[5]	8 <sup>1</sup>	H+36
9	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
10	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 172: Base Station Status

Bit #	Mask	Description	Bit = 0	Bit = 1
0	0x00000001	Validity of the base station	Valid	Invalid

Table 173: Base Station Type

Binary	ASCII	Description
0	NONE	Base station is not used
1 - 3	Reserved	
4	RTCMV3	Base station is RTCMV3

The REFSTATION log can be used for checking the operational status of a remotely located base station. You can verify that the base station is operating properly without traveling to it. This is especially useful for RTK work on long baselines.

<sup>1</sup>In the binary log case, an additional 3 bytes of padding are added to maintain 4-byte alignment.

## 3.157 REFSTATIONINFO

### *Base Station position information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This is an extended version of the REFSTATION log with latitude, longitude and ellipsoidal height of the base station in WGS84. In addition to the base station position, ARP height, antenna model name and antenna serial number are available if provided by the base station only through RTCMV3.

**Message ID:** 1325

**Log Type:** Asynch

**Recommended Input:**

```
log refstationinfoa onchanged
```

**ASCII Example:**

```
#REFSTATIONINFOA,USB1,0,89.5,EXACT,0,0.000,02000040,d38f,6782;51.116375174,-114.038254922,1048.502830628,WGS84,1.234,0,RTCMV3,"0","702GG","NVH05410007"*bedf8ece
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	REFSTATIONINFO header	Log header. See <i>Messages</i> on page 30 for more information.	H	0	
2	latitude	Latitude (degrees)	Double	8	H
3	longitude	Longitude (degrees)	Double	8	H+8
4	height	Ellipsoidal Height (m)	Double	8	H+16
5	datum	Datum ID number 61 = WGS84 63 = USER (default = WGS84)	Enum	4	H+24
6	ARP height	Base Antenna ARP (m)	Float	4	H+28
7	health	Base Station Health, see <i>Table 172: Base Station Status</i> on the previous page	Ulong	4	H+32
8	Ref Stn Type	Base Station Type, see ( <i>Table 173: Base Station Type</i> on the previous page)	Enum	4	H+36
9	stn ID	Base Station ID	Char[5]	8 <sup>1</sup>	H+40

<sup>1</sup>In the binary log case, an additional 3 bytes of padding are added to maintain 4-byte alignment.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	Ant Model	Base Antenna Model Name	Char [32]	32	H+48
11	Ant Serial	Base Antenna Serial Number	Char [32]	32	H+80
12	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+112
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.158 ROVERPOS

### *Position using ALIGN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

ALIGN generates distance and bearing information between a master and rover receiver. This log outputs the position information of the rover when using the ALIGN feature. This log can only be output from a Y ALIGN model and can be output at both Master and Rover ends.

You must have an ALIGN capable receiver to use this log.

- ALIGN is useful for obtaining the relative directional heading of a vessel/body, separation heading between two vessels/bodies, or heading information with moving base and pointing applications.
- The log can be output at the Y model Rover only if it is receiving the RTCAREFEXT message from the Master. The log can be output at any Master if the Master is receiving HEADINGEXTB from the Rover. Refer to the NovAtel application note [APN-048: ALIGN Family of Heading Solutions](https://www.novatel.com/support/support-materials/application-notes) for details on HEADINGEXT (available at [novatel.com/support/support-materials/application-notes](https://www.novatel.com/support/support-materials/application-notes)).
- ROVERPOS is dependent on the output frequency of the RTCAREFEXT message from the master to the rover.
- On dual antenna receivers, the **ROVERPOS** log outputs the position for the secondary antenna input.

**Message ID:** 1052

**Log Type:** Asynch

**Recommended Input:**

```
log roverposa onchanged
```

**ASCII Example:**

```
#ROVERPOSA,COM1,0,21.5,FINESTEERING,1544,340322.000,02000008,7453,4655;  
SOL_COMPUTED,NARROW_INT,51.11605565964,-114.03854655975,1055.8559,-16.9000,  
WGS84,0.0130,0.0122,0.0206,"RRRR",0.0,0.0,13,12,12,11,0,0,0,0*635b3a1c
```

Asynchronous logs, such as ROVERPOS, should only be logged ONCHANGED or ONNEW otherwise the most current data is not output when it is available. This is especially true of the ONTIME trigger, which may cause inaccurate time tags to result.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	ROVERPOS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
2	sol stat	Solution Status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H

### 3.159 RTCMV3 Standard Logs

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

NovAtel's RTCMv3 logs are implementations of the messages described by the RTCM SC-104 committee's "Differential GNSS (Global Navigation Satellite Systems) Services – Version 3" standard. These messages are primarily intended to support RTK operations. They are also an alternative raw data format to NovAtel's proprietary messages.

The RTCMv3 logs can be divided into several categories that are described below. An RTK base station must minimally transmit one or more observable message, together with one or more station and antenna message. The **GENERATERTKCORRECTIONS** command on page 177 illustrates an appropriate set of messages and is an easy way to configure logging.

**Example Input:**

```
interfacemode com2 none RTCMV3
fix position 51.1136 -114.0435 1059.4
thisantennatype NOV702
log com2 rtcml1006 ontime 10
log com2 rtcml1033 ontime 10 2
log com2 rtcml1004 ontime 1
log com2 rtcml1012 ontime 1
```

**Example Input using MSM4 messages:**

```
interfacemode com1 none rtcmv3 off
thisantennatype nov850
fix position 51.1136 -114.0435 1059.4
log com1 rtcml1006 ontime 10
log com1 rtcml1033 ontime 10 2
log com1 rtcml1074 ontime 1
log com1 rtcml1084 ontime 1
log com1 rtcml1094 ontime 1
log com1 rtcml1124 ontime 1
```

#### 3.159.1 Legacy Observable Messages

The legacy observable messages contain GPS and GLONASS code and phase observables. The *extended* messages additionally contain the C/N0.

**Table 174: Legacy Observable Messages**

Log Name	Message ID	Description
RTCM1001	772	GPS L1-only observables, basic

Log Name	Message ID	Description
RTCM1002	774	GPS L1-only observables, extended
RTCM1003	776	GPS L1/L2 basic observables, basic
RTCM1004	770	GPS L1/L2 basic observables, extended
RTCM1009	885	GLONASS L1-only observables, basic
RTCM1010	887	GLONASS L1-only observables, extended
RTCM1011	889	GLONASS L1/L2 basic observables, basic
RTCM1012	891	GLONASS L1/L2 basic observables, extended

### 3.159.2 MSM Observable Messages

The Multiple Signal Messages (MSM) are observable messages for all current GNSS systems. They provide a standardized framework for message content and are designed to support future systems and signals.

Sending legacy (1001-1004 and 1009-1012) and MSM messages in the same stream can cause problems for remote RTK users and is not recommended.

Each GNSS system has a set of seven MSM types numbered from 1 to 7. The MSM type for each GNSS system provides the same generic information. Generally, as the MSM number increases, more information is available in the messages. For example, MSM1 for each GNSS system provides the code measurements for the system, while MSM3 provides both the code and phase.

The information encoded in each MSM variant is described in *Table 175: MSM Type Descriptions* below for the descriptions of each of the seven MSM types. For RTK operations, MSM3 is minimally recommended.

**Table 175: MSM Type Descriptions**

Message	Description
MSM1	Provides the code measurements.
MSM2	Provides the phase measurements.
MSM3	Provides the data from MSM1 (code) and MSM2 (phase) in a single message.
MSM4	Provides all the data from MSM3 (code and phase) and adds the CNR measurements.
MSM5	Provides all the data from MSM4 (code, phase and CNR) and adds the doppler measurements.
MSM6	Provides the same information as MSM4, but has extended resolution on the measurements.
MSM7	Provides the same information as MSM5, but has extended resolution on the measurements.

*Table 176: MSM Log Names* on the next page lists the MSM message name and *Table 177: MSM Message IDs* on the next page lists the message IDs.

Table 176: MSM Log Names

Message	GPS	GLONASS	Galileo	QZSS	BeiDou
MSM1	RTCM1071	RTCM1081	RTCM1091	RTCM1111	RTCM1121
MSM2	RTCM1072	RTCM1082	RTCM1092	RTCM1112	RTCM1122
MSM3	RTCM1073	RTCM1083	RTCM1093	RTCM1113	RTCM1123
MSM4	RTCM1074	RTCM1084	RTCM1094	RTCM1114	RTCM1124
MSM5	RTCM1075	RTCM1085	RTCM1095	RTCM1115	RTCM1125
MSM6	RTCM1076	RTCM1086	RTCM1096	RTCM1116	RTCM1126
MSM7	RTCM1077	RTCM1087	RTCM1097	RTCM1117	RTCM1127

Table 177: MSM Message IDs

Message	GPS	GLONASS	Galileo	QZSS	BeiDou
MSM1	1472	1479	1486	1648	1592
MSM2	1473	1480	1487	1649	1593
MSM3	1474	1481	1488	1650	1594
MSM4	1475	1482	1489	1651	1595
MSM5	1476	1483	1490	1652	1596
MSM6	1477	1484	1491	1653	1597
MSM7	1478	1485	1492	1654	1598

### 3.159.3 Station and Antenna Messages

The station and antenna messages listed in *Table 178: Station and Antenna Messages* on the next page provide the base station's coordinates and hardware. Remote RTK users require this information so that they can position themselves relative to a base station.

- Message Type 1005 provides the Earth-Centered, Earth-Fixed (ECEF) coordinates of the Antenna Reference Point (ARP). The ARP is an explicit physical point on the antenna, typically the center of its base. It is related to the antenna phase center from where the measurements are emitted via the Phase Center Offsets (PCOs). The PCOs can be set using the **THISANTENNAPCO** command (see page 355) or **THISANTENNATYPE** command (see page 357). If the PCOs are not set, then the coordinates transmitted by Message types 1005 and 1006 will be those that the receiver is fixed to by the **FIX** command (see page 160).
- Message Type 1006 is the same as 1005 but additionally provides the antenna height. This value is always set to zero by the receiver firmware.
- Message Type 1007 provides the base station antenna type. Conventionally, the antenna name from the International GNSS Service (IGS) is used. The antenna name can be set using the **THISANTENNATYPE** command (see page 357).

- Message Type 1008 is the same as 1007 but additionally provides the antenna serial number. The serial number is always set to null by the receiver firmware.
- Message Type 1033, like message types 1007 and 1008, also provides the antenna information. Message type 1033 additionally provides the receiver type and firmware version. The primary use of this information is to more-easily enable RTK rovers to fix their GLONASS ambiguities. This information is filled automatically and appropriately by the receiver firmware.

For a receiver operating as an RTK base station, the recommended messages to transmit are 1006 and 1033. With these messages remote RTK users have all the information describing the base station.

**Table 178: Station and Antenna Messages**

Log Name	Message ID	RTCM Message Type	Description
RTCM1005	765	1005	Stationary RTK Base Station Antenna Reference Point (ARP)
RTCM1006	768	1006	Stationary RTK Base Station ARP with Antenna Height
RTCM1007	852	1007	Extended Antenna Descriptor and Setup Information
RTCM1008	854	1008	Extended Antenna Reference Station Description and Serial Number
RTCM1033	1097	1033	Receiver and antenna descriptors

### 3.159.4 Ephemeris Messages

The ephemeris messages listed in *Table 179: Ephemeris Messages* below provide the satellite ephemerides. For RTK operations this information is optional, as RTK rovers will be downloading their own ephemerides directly from the satellites.

There are two messages for each ephemeris type. For the messages logged ONTIME (e.g. LOG RTCM1019 ONTIME 10) a single satellite's ephemeris is output at each ONTIME interval. The ephemerides will be cycled through in numerical order. For the messages logged ONCHANGED (e.g., LOG RTCM1019ASYN ONCHANGED), new or changed ephemerides will be output as soon as they are available.

**Table 179: Ephemeris Messages**

Log Name	Message ID	RTCM Message Type	Description
RTCM1019	893	1019	GPS Ephemerides, logged ONTIME
RTCM1019ASYN	2088	1019	GPS Ephemerides, logged ONCHANGED
RTCM1020	895	1020	GLONASS Ephemerides, logged ONTIME
RTCM1020ASYN	2089	1020	GLONASS Ephemerides, logged ONCHANGED
RTCM1042	2171	1042	BeiDou Ephemerides, logged ONTIME
RTCM1042ASYN	2170	1042	BeiDou Ephemerides, logged ONCHANGED
RTCM1044	2177	1044	QZSS Ephemerides, logged ONTIME

Log Name	Message ID	RTCM Message Type	Description
RTCM1044ASYNC	2176	1044	QZSS Ephemerides, logged ONCHANGED
RTCM1045	2173	1045	Galileo F/NAV Ephemerides, logged ONTIME
RTCM1045ASYNC	2172	1045	Galileo F/NAV Ephemerides, logged ONCHANGED
RTCM1046	2175	1046	Galileo I/NAV Ephemerides, logged ONTIME
RTCM1046ASYNC	2174	1046	Galileo I/NAV Ephemerides, logged ONCHANGED

## 3.160 RTKASSISTSTATUS

### *RTK ASSIST status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log provides information on the state of RTK ASSIST.

RTK ASSIST operates in two modes: coast and full assist. The RTKASSISTSTATUS log reports which mode is currently available. Coast mode is available as soon as the RTK ASSIST corrections are received from the L-Band satellite, while full assist mode requires a convergence period. In coast mode, position error growth during RTK correction outages is slightly worse than in full assist mode and RTK will not resume following a full signal outage until after RTK corrections are restored. Full assist gives the lowest position error growth during RTK correction outages, and makes it possible for RTK to resume even if there are complete GNSS signal outages during the RTK ASSIST period.

The RTK ASSIST ACTIVE state reported in the RTKASSISTSTATUS log is also reported in the RTKPOS and BESTPOS extended solution status field. See *Table 84: Extended Solution Status* on page 436.

The RTKASSISTSTATUS log reports the time remaining in the RTK ASSIST ACTIVE state. Once RTK ASSIST becomes active, the remaining time will count down from the time out set by the **RTKASSISTTIMEOUT** command (see page 286).

The corrections age reported in the RTKASSISTSTATUS log should typically be below 30 seconds. If the age exceeds this value, then L-Band tracking is likely degraded. The most likely cause of degraded L-Band tracking are obstructions between the antenna and the L-Band satellite.

**Message ID:** 2048

**Log Type:** Synch

**Recommended Input:**

```
log rtkassiststatusa ontime 5
```

**ASCII Example:**

```
#RTKASSISTSTATUSA,COM1,0,80.0,FINESTEERING,1932,491359.000,02000020,80fe,46672;  
ACTIVE,ASSIST,969.0,14.0*26e32616
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RTKASSISTSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	State	State: INACTIVE (0) ACTIVE (1)	Enum	4	H

Field	Field type	Description	Format	Binary Bytes	Binary Offset
3	Mode	Mode: UNAVAILABLE (0) COAST (1) ASSIST (2)	Enum	4	H+4
4	Remaining time	Time remaining in seconds	Float	4	H+8
5	Corrections age	Age of the RTK ASSIST corrections in seconds. Maximum value of 120 seconds.	Float	4	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+16
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.161 RTKDATUMINFO

#### *Datum information for the RTK position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution in the **RTKPOS** log (see page 765).

**Message ID:** 2304

**Log Type:** Asynch

**Recommended Input:**

```
log rtkdatuminfoa onchanged
```

**ASCII Example:**

```
#RTKDATUMINFOA, COM1, 0, 50.0, FINESTEERING, 2121, 230450.000, 02040020, 0b0c, 32768;
"UNKNOWN", 0, 0.000, SERVICE_DETAILS_UNKNOWN*aa3e54b5
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RTKDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the <b>RTKPOS</b> log.	Char [32]	variable	H
3	epsg_code	EPSG code of datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year) Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation Status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
7	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 3.162 RTKDOP

### *DOP values for the satellites used in the RTK solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

The RTKDOP log contains the Dilution Of Precision (DOP) values for the satellites being used in the RTK solution. Note that unlike the **PSRDOP** log (see page 670), the RTKDOP log is synchronous. DOP values will be calculated at the requested rate, up to a maximum rate of 1 Hz.

DOP values are a measure of the solution strength. Essentially, the DOPs reflect the geometry of the satellites used in the solution. Solutions with good counts of well-distributed satellites will have low DOPs and should be accurate and reliable. Solutions with fewer or poorly-distributed satellites will have high DOPs and be less accurate and reliable. As a rough guideline, PDOP values less than 4 imply a solution with reasonable geometry.

There can be many reasons for high DOP values. The most common reason is that there are obstructions limiting satellite visibility. Even if satellites are visible and being tracked they might still not be used in the solution if, for example, they are unhealthy or there aren't corrections available for them. The **RTKSATS** log (see page 768) will inform which satellites are being tracked and explain why a tracked satellite is not used in the solution.

The DOPs do not consider that different satellites or signals will be weighted differently in the solution. Therefore, they do not completely reflect the solution quality. Ultimately, the standard deviations reported in the **RTKPOS** log (see page 765) are the best reflection of the solution accuracy.

**Message ID:** 952

**Log Type:** Synch

**Recommended Input:**

```
log rtkdopa ontime 10
```

**ASCII Example:**

```
#RTKDOPA,COM1,0,60.0,FINESTEERING,1449,446982.000,02000008,b42b,3044;2.3386,1.9856,0.9407,1.5528,1.2355,10.0,11,21,58,6,7,10,16,18,24,26,29,41*85f8338b
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RTKDOP header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	GDOP	Geometric DOP	Float	4	H
3	PDOP	Position DOP	Float	4	H+4
4	HDOP	Horizontal DOP	Float	4	H+8
5	HTDOP	Horizontal and time DOP	Float	4	H+12
6	TDOP	GPS Time DOP	Float	4	H+16
7	elev mask	GPS elevation mask angle	Float	4	H+20
8	#sats	Number of satellites to follow	Ulong	4	H+24

Field	Field type	Description	Format	Binary Bytes	Binary Offset
9	sats	Satellites in use at time of calculation	Ulong	4	H+28
10	Next satellite offset = $H+28+(\#sats * 4)$				
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	$H+28+(\#sats * 4)$
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.163 RTKDOP2

#### *DOP values for the satellites used in the RTK solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

The RTKDOP2 log contains the Dilution Of Precision (DOP) values for the satellites being used in the RTK solution. This log is similar to the **RTKDOP** log (see page 761) but contains the per-system TDOPs; see the **RTKDOP** log on page 761 for more information on the DOPs.

**Message ID:** 1172

**Log Type:** Synch

**Recommended Input:**

```
log rtkdop2a ontime 10
```

**ASCII Example:**

```
#RTKDOP2A,COM1,0,80.0,FINESTEERING,1690,601478.000,02000008,ab50,43488;1.5000,1.1850,0.6580,0.9850,2,GPS,0.6530,GLONASS,0.6490*c5f1a25f
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RTKDOP2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	GDOP	Geometric DOP	Float	4	H
3	PDOP	Position DOP	Float	4	H+4
4	HDOP	Horizontal DOP	Float	4	H+8
5	VDOP	Vertical DOP	Float	4	H+12
6	#systems	Number of entries to follow	Ulong	4	H+16
7	system	See <i>Table 180: System Used for Timing</i> on the next page	Enum	4	H+20
8	TDOP	Time DOP (Dilution of Precision)	Float	4	H+24
9	Next satellite offset = H+20+(#systems * 8)				
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+20+ (#systems * 8)
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 180: System Used for Timing**

<b>Binary</b>	<b>ASCII</b>
0	GPS <sup>1</sup>
1	GLONASS
2	GALILEO
3	BEIDOU
4	NAVIC
99	AUTO <sup>2</sup>

---

<sup>1</sup>GPS setting includes QZSS satellites.

<sup>2</sup>AUTO is used only as a backup system (not available for primary system field).

## 3.164 RTKPOS

### *RTK low latency position data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the low latency RTK position computed by the receiver, along with two status flags. In addition, it reports other status indicators, including differential age, which is useful in predicting anomalous behavior brought about by outages in differential corrections. This log is recommended for kinematic operation. Better accuracy can be obtained in static operation with the **MATCHEDPOS** log (see page 607).

With the system operating in an RTK mode, this log reflects if the solution is a good RTK low latency solution (from extrapolated base station measurements) or invalid. A valid RTK low latency solution is computed for up to 60 seconds after reception of the last base station observation. The degradation in accuracy, due to differential age, is reflected in the standard deviation fields. See also the **DGPSTXID** command (see page 124).

The RTK system in the receiver provides two kinds of position solutions. The Matched RTK position is computed with buffered observations, so there is no error due to the extrapolation of base station measurements. This provides the highest accuracy solution possible at the expense of some latency which is affected primarily by the speed of the differential data link. The **MATCHEDPOS** log (see page 607) contains the matched RTK solution and can be generated for each processed set of base station observations.

The Low-Latency RTK position is computed from the latest local observations and extrapolated base station observations. This supplies a valid RTK position with the lowest latency possible at the expense of some accuracy. The degradation in accuracy is reflected in the standard deviation. The amount of time that the base station observations are extrapolated is in the "differential age" field of the position log. The Low-Latency RTK system extrapolates for 60 seconds. The **RTKPOS** log contains the Low-Latency RTK position when valid, and an "invalid" status when a Low-Latency RTK solution could not be computed. The **BESTPOS** log (see page 429) contains either the low-latency RTK, PPP or pseudorange-based position, whichever has the smallest standard deviation.

**Message ID:** 141

**Log Type:** Synch

**Recommended Input:**

```
log rtkposa ontime 1
```

**ASCII Example:**

```
#RTKPOSA, COM1, 0, 54.5, FINESTEERING, 1419, 340040.000, 02000040, 176e, 2724;  
SOL_COMPUTED, NARROW_INT, 51.11635911294, -114.03833103654, 1063.8336, -16.2712,  
WGS84, 0.0179, 0.0096, 0.0174, "AAAA", 1.000, 0.000, 12, 11, 11, 11, 0, 01, 0, 33*0adb3e47
```

Consider the case of a racing car, on a closed circuit, requiring RTK operation. In this situation, you would have to send live data to the pits using a radio link.

RTK operation enables live centimeter level position accuracy. When answers are required in the field, the base station must transmit information to the rover in real-time. For RTK operation, extra equipment such as radios are required to transmit and receive this information. The base station has a corresponding base radio and the rover station has a corresponding rover radio.

Post-processing can provide post-mission position and velocity data using raw GNSS data collected from the car. The logs necessary for post-processing include:

```
RANGECMPB ONTIME 1
RAWEPHEMB ONNEW
```

These are examples of data collection for post-processing, and real-time operation. OEM7-based output is compatible with post-processing software from the NovAtel's Waypoint Products Group or refer to our website at [novatel.com/products/waypoint-software](http://novatel.com/products/waypoint-software) for more details.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RTKPOS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status (see <i>Table 80: Solution Status</i> on page 432)	Enum	4	H

24	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.165 RTKSATS

### *Satellites used in RTKPOS solution*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log lists the used and unused satellites for the corresponding RTKPOS solution. It also describes the signals of the used satellites and reasons for exclusions.

**Message ID:** 1174

**Log Type:** Synch

**Recommended Input:**

```
log rtkstats ontime 1
```

**Abbreviated ASCII Example:**

```
<RTKSATS COM1 0 60.5 FINESTEERING 1728 524924.000 02000000 95e7 11487

## 3.166 RTKVEL

### *RTK velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the RTK velocity information computed by the receiver. In addition, it reports a velocity status indicator that is useful in indicating whether or not the corresponding data is valid and differential age is useful in predicting anomalous behavior brought about by outages in differential corrections. The velocity measurements sometimes have a latency associated with them. The time of validity is the time tag in the log minus the latency value.

Velocities from the RTK filter are calculated from the delta-position. In RTKVEL, the velocity type is the same as the position type.

In an RTKVEL log, the actual speed and direction of the receiver antenna over ground is provided. The receiver does not determine the direction a vessel, craft or vehicle is pointed (heading) but rather the direction of motion of the GNSS antenna relative to ground.

With the system operating in an RTK mode, this log reflects if the solution is a good RTK low latency solution (from extrapolated base station measurements) or invalid. A valid RTK low latency solution is computed for up to 60 seconds after reception of the last base station observation.

The velocity is computed from consecutive RTK low latency updates. As such, it is an average velocity based on the time difference between successive position computations and not an instantaneous velocity at the RTKVEL time tag. The velocity latency to be subtracted from the time tag is normally half the time between filter updates. Under default operation, the RTK low latency filter is updated at a rate of 2 Hz. This translates into a velocity latency of 0.25 seconds. The latency can be reduced by increasing the update rate of the RTK low latency filter by requesting the BESTVEL, RTKVEL, BESTPOS or RTKPOS messages at a rate higher than 2 Hz. For example, a logging rate of 10 Hz would reduce the velocity latency to 0.05 seconds. For integration purposes, the velocity latency should be applied to the record time tag.

**Message ID: 216**

**Log Type: Synch**

**Recommended Input:**

```
log rtkvela ontime 1
```

**ASCII Example:**

```
#RTKVELA,COM1,0,43.5,FINESTEERING,1364,496137.000,02100000,71e2,2310;  
SOL_COMPUTED,NARROW_INT,0.250,1.000,0.0027,207.645811,0.0104,0.0*f551cc42
```

Consider the case of an unmanned aircraft. A base station must send differential correction data to the remote aircraft. In this type of application, the aircraft's radio may pass the differential solution, for example RTKVEL, to the positioning system so it can process it and generate precise position information for the flight controls.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RTKVEL header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status, see <i>Table 80: Solution Status</i> on page 432	Enum	4	H
3	vel type	Velocity type, see <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	latency	A measure of the latency in the velocity time tag in seconds. It should be subtracted from the time to give improved results	Float	4	H+8
5	age	Differential age in seconds	Float	4	H+12
6	hor spd	Horizontal speed over ground, in meters per second	Double	8	H+16
7	trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees	Double	8	H+24
8	vert spd	Vertical speed, in meters per second, where positive values indicate increasing altitude (up) and negative values indicate decreasing altitude (down)	Double	8	H+32
9	Reserved		Float	4	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.167 RTKXYZ

### *RTK Cartesian position and velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log contains the receiver's low latency position and velocity in ECEF coordinates. The position and velocity status fields indicate whether or not the corresponding data is valid. See *Figure 12: The WGS84 ECEF Coordinate System* on page 448 for a definition of the ECEF coordinates.

The velocity measurements have a latency associated with them. The time of validity is the time tag in the log minus the latency value.

With the system operating in an RTK mode, this log reflects if the solution is a good RTK low latency solution (from extrapolated base station measurements) or invalid. A valid RTK low latency solution is computed for up to 60 seconds after reception of the last base station observation. The degradation in accuracy due to differential age is reflected in the standard deviation fields. See also the **DGPSTXID** command (see page 124).

The velocity is computed from consecutive RTK low latency updates. As such, it is an average velocity based on the time difference between successive position computations and not an instantaneous velocity at the RTKVEL time tag. The velocity latency to be subtracted from the time tag is normally half the time between filter updates. Under default operation, the RTK low latency filter is updated at a rate of 2 Hz. This translates into a velocity latency of 0.25 seconds. The latency can be reduced by increasing the update rate of the RTK low latency filter by requesting the **BESTXYZ** message at a rate higher than 2 Hz. For example, a logging rate of 10 Hz would reduce the velocity latency to 0.05 seconds. For integration purposes, the velocity latency should be applied to the record time tag.

See also the **BESTXYZ** log on page 446 and **MATCHEDXYZ** log on page 612.

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID:** 244

**Log Type:** Synch

**Recommended Input:**

```
log rtkxyza ontime 1
```

**ASCII Example:**

```
#RTKXYZA, COM1, 0, 56.0, FINESTEERING, 1419, 340041.000, 02000040, 3d88, 2724;

## 3.168 RXCONFIG

### *Receiver configuration*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log is used to output a list of all current command settings. When requested, an RXCONFIG log is output for each setting. See also the **LOGLIST** log on page 593 for a list of currently active logs. One log is output for each current command.

**Message ID:** 128

**Log Type:** Collection

**Recommended Input:**

```
log rxconfiga once
```

**ASCII Example:**

```
#RXCONFIGA, COM1, 71, 47.5, APPROXIMATE, 1337, 333963.260, 02000000, f702, 1984;

#RXCONFIGA, COM1, 0, 47.5, FINESTEERING, 1337, 400416.370, 02000000, f702, 1984;
#LOGA, COM1, 0, 47.5, FINESTEERING, 1337, 400416.370, 02000000, f702, 1984; COM2, PASSCOM2
A, ONCHANGED, 0.000000, 0.000000, NOHOLD*55fc0c62*17086d18
```

The embedded CRCs are flipped to make the embedded messages recognizable to the receiver. For example, consider the first embedded message above.

```
91f89b07: 10010001111110001001101100000111
          11100000110110010001111110001001:e0d91f89
```

The CRC is really **e0d91f89**.

Do not use undocumented commands or logs! Doing so may produce errors and void your warranty.

The RXCONFIG log can be used to ensure your receiver is correctly setup for your application.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RXCONFIG header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	e header	Embedded header	-	h	H
3	e msg	Embedded message	Varied	a	H+h
4	e xxxx	Embedded (inverted) 32-bit CRC (ASCII and Binary only). The embedded CRC is inverted so that the receiver does not recognize the embedded messages as messages to be output but continues with the RXCONFIG message. If you wish to use the messages output from the RXCONFIG log, simply flip the embedded CRC around for individual messages	Ulong	4	H+h+a
5	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+h+a+4
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.169 RXSTATUS

### *Receiver status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log conveys various status parameters of the GNSS receiver system. These include the Receiver Status and Error words which contain several flags specifying status and error conditions. If an error occurs (shown in the Receiver Error word), the receiver idles all channels, turns off the antenna and disables the RF hardware as these conditions are considered to be fatal errors. The log contains a variable number of status words to allow for maximum flexibility and future expansion. For information about resolving an error, refer to Examining the RXSTATUS Log in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

The receiver gives the user the ability to determine the importance of the status bits. In the case of the Receiver Status, setting a bit in the priority mask causes the condition to trigger an error. This causes the receiver to idle all channels, turn off the antenna and disable the RF hardware, the same as if a bit in the Receiver Error word is set. Setting a bit in an Auxiliary Status priority mask causes that condition to set the bit in the Receiver Status word corresponding to that Auxiliary Status. See also the **STATUSCONFIG** command on page 346.

Field #4, the receiver status word as represented in *Table 182: Receiver Status* on page 781, is also in Field #8 of the header. See the ASCII Example below and *Table 182: Receiver Status* on page 781 for clarification.

Refer also to Built-In Status Tests in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

**Message ID:** 93

**Log Type:** Asynch

**Recommended Input:**

```
log rxstatusa onchanged
```

**Abbreviated ASCII Example:**

```
#RXSTATUS USB1 0 67.0 FINESTEERING 2070 159546.023 02000000 2ae1 15824
00000000 5 (Receiver Error)
    02000000 00000000 00000000 00000000 (Receiver Status)
    00040000 00001008 00000000 00000000 (Aux1 Status)
    00000000 00000000 80000000 00000000 (Aux2 Status)
    80000000 00000000 00000000 00000000 (Aux3 Status)
    0030c000 00000000 ffffffff 00000000 (Aux4 Status)
```

Receiver errors automatically generate event messages. These event messages are output in RXSTATUSEVENT logs. It is also possible to have status conditions trigger event messages to be generated by the receiver. This is done by setting/clearing the appropriate bits in the event set/clear masks. The set mask tells the receiver to generate an event message when the bit becomes set. Likewise, the clear mask causes messages to be generated when a bit is cleared. See the **STATUSCONFIG** command on page 346 for details.

If you wish to disable all these messages without changing the bits, simply UNLOG the **RXSTATUSEVENT** logs on the appropriate ports. See the **UNLOG** command on page 374.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RXSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	error	Receiver error (see <i>Table 181: Receiver Error</i> on the next page). A value of zero indicates no errors	Ulong	4	H
3	# stats	Number of status codes (including Receiver Status). Each status code consists of 4 fields, the status, priority mask, event set mask and event clear mask. Each set is repeated for each status type.  Note that for clarity, the Receiver Status, Auxiliary 1 Status, Auxiliary 2 Status, Auxiliary 3 Status and Auxiliary 4 status are listed separately in this message	Ulong	4	H+4
4	rxstat	Receiver status word (see <i>Table 182: Receiver Status</i> on page 781)	Ulong	4	H+8
5	rxstat pri	Receiver status priority mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+12
6	rxstat set	Receiver status event set mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+16
7	rxstat clear	Receiver status event clear mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+20
8	aux1stat	Auxiliary 1 status word (see <i>Table 184: Auxiliary 1 Status</i> on page 783)	Ulong	4	H+24
9	aux1stat pri	Auxiliary 1 status priority mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+28
10	aux1stat set	Auxiliary 1 status event set mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+32
11	aux1stat clear	Auxiliary 1 status event clear mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+36
12	aux2stat	Auxiliary 2 status word (see <i>Table 185: Auxiliary 2 Status</i> on page 784)	Ulong	4	H+40
13	aux2stat pri	Auxiliary 2 status priority mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+44
14	aux2stat set	Auxiliary 2 status event set mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+48
15	aux2stat clear	Auxiliary 2 status event clear mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+52

Field	Field type	Description	Format	Binary Bytes	Binary Offset
16	aux3stat	Auxiliary 3 status word (see <i>Table 186: Auxiliary 3 Status</i> on page 786)	Ulong	4	H+56
17	aux3stat pri	Auxiliary 3 status priority mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+60
18	aux3stat set	Auxiliary 3 status event set mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+64
19	aux3stat clear	Auxiliary 3 status event clear mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+68
20	aux4stat	Auxiliary 4 status word (see <i>Table 188: Auxiliary 4 Status</i> on page 788)	Ulong	4	H+72
21	aux4stat pri	Auxiliary 4 status priority mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+76
22	aux4stat set	Auxiliary 4 status event set mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+80
23	aux4stat clear	Auxiliary 4 status event clear mask, which can be set using the <b>STATUSCONFIG</b> command on page 346	Ulong	4	H+84
24	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+88
25	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

	31	0x80000000	RF Calibration Data is present	No data found	Data exists and has no errors

Table 187: Antenna Gain State

Bits 4-5 or Bits 6-7	Description
00	Antenna Gain in range
01	Antenna Gain Low This state indicates that the input signal is very weak (under -160 dBm/Hz). It can indicate the antenna is not operating correctly, the antenna is not suitable for NovAtel receivers, or there is no antenna connected.
10	Antenna Gain High. This state indicates that the input signal is very strong (above -120 dBm/Hz). This can be caused by a strong in-band interference or by too much signal gain or too many LNAs cascaded in the path.
11	Antenna Gain Anomaly. This state indicates that an anomaly has been detected for the input signal. It can be caused by strong in-band or out-of-band interference, or by the antenna being disconnected/changed during operation.

Table 188: Auxiliary 4 Status

Nibble	Bit	Mask	Description	Bit = 1
N0	0	0x00000001	GNSS Tracked Status	<60% of available satellites are tracked well
	1	0x00000002		<15% of available satellites are tracked well
	2	0x00000004	Reserved	
	3	0x00000008		
N1	4	0x00000010	Reserved	
	5	0x00000020		
	6	0x00000040		
	7	0x00000080		
N2	8	0x00000100	Reserved	
	9	0x00000200		
	10	0x00000400		
	11	0x00000800		
N3	12	0x00001000	Clock freewheeling due to bad position integrity	Clock freewheeling
	13	0x00002000	Reserved	
	14	0x00004000	Usable RTK Corrections	<60% of expected corrections available
	15	0x00008000	Percentage of expected measurements which have timely RTK corrections (latency <20 seconds)	<15% of expected corrections available
N4	16	0x00010000	Bad RTK Geometry	PDOP >5.0
	17	0x00020000	Reserved	
	18	0x00040000		
	19	0x00080000	Long RTK Baseline	Baseline >50 km

Nibble	Bit	Mask	Description	Bit = 1
N5	20	0x00100000	Poor RTK COM Link (poor correction quality)	Corrections quality ≤60%
	21	0x00200000	Poor ALIGN COM Link (poor correction quality)	Corrections quality ≤60%
	22	0x00400000	GLIDE Not Active	GLIDE not active
	23	0x00800000	Bad PDP Geometry	PDOP >5.0
N6	24	0x01000000	No TerraStar Subscription	No subscription
	25	0x02000000	Reserved	
	26	0x04000000		
	27	0x08000000		
N7	28	0x10000000	Bad PPP Geometry	PDOP >5.0
	29	0x20000000	Reserved	
	30	0x40000000	No INS Alignment	No alignment
	31	0x80000000	INS not converged	Not converged

Only GPS and GLONASS are considered in the Auxiliary 4 status word states.

For bits relating to RTK, ALIGN or INS, the bits will only be set if the receiver has that type of positioning is enabled via Auth Code.

## 3.170 RXSTATUSEVENT

### *Status event indicator*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log is used to output event messages as indicated in the **RXSTATUS** log (see page 777). An event message is automatically generated for all receiver errors, which are indicated in the receiver error word. In addition, event messages can be generated when other conditions, which are indicated in the receiver status and auxiliary status words, are met. Whether or not an event message is generated under these conditions is specified using the **STATUSCONFIG** command (see page 346).

On start-up, the receiver is set to log **RXSTATUSEVENTA ONNEW HOLD** on all ports. You can remove this message using the **UNLOG** command (see page 374). To remove this log using an **UNLOGALL** command (see page 376), you must use the **True** option. Logging **RXSTATUSEVENT** on all ports is a factory default setting. If it is unlogged, the **RXSTATUSEVENT** log will not be collected until the next start-up. After a start-up, logging **RXSTATUSEVENT** on all ports will start again.

See also Built-In Status Tests in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

**Message ID:** 94

**Log Type:** Asynch

**Recommended Input:**

```
log rxstatuseventa onchanged
```

**ASCII Example 1:**

```
#RXSTATUSEVENTA, COM1, 0, 17.0, FREEWHEELING, 1337, 408334.510, 02480000, b967, 1984; STA  
TUS, 19, SET, "No Valid Position Calculated"*6de945ad
```

**ASCII Example 2:**

```
#RXSTATUSEVENTA, COM1, 0, 41.0, FINESTEERING, 1337, 408832.031, 03000400, b967, 1984; STA  
TUS, 10, SET, "COM3 Transmit Buffer Overrun"*5b5682a9
```

When a fatal event occurs (for example, in the event of a receiver hardware failure), a bit is set in the receiver error word, part of the **RXSTATUS** log (see page 777) to indicate the cause of the problem. Bit 0 is set in the receiver status word to show that an error occurred, the error strobe is driven high and the LED flashes red and yellow showing an error code. An **RXSTATUSEVENT** log is generated on all ports to show the cause of the error. Receiver tracking is disabled at this point but command and log processing continues to allow you to diagnose the error. Even if the source of the error is corrected at this point, the receiver must be reset to resume normal operation.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	RXSTATUSEVENT header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	word	The status word that generated the event message (see <i>Table 189: Status Word</i> below)	Enum	4	H
3	bit position	Location of the bit in the status word (see <i>Table 182: Receiver Status</i> on page 781, <i>Table 184: Auxiliary 1 Status</i> on page 783, <i>Table 185: Auxiliary 2 Status</i> on page 784, <i>Table 186: Auxiliary 3 Status</i> on page 786 or <i>Table 188: Auxiliary 4 Status</i> on page 788)	Ulong	4	H+4
4	event	Event type (see <i>Table 190: Event Type</i> below)	Enum	4	H+8
5	description	This is a text description of the event or error	Char [32]	32	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 189: Status Word**

Binary	ASCII	Description
0	ERROR	Receiver Error word, see <i>Table 181: Receiver Error</i> on page 779
1	STATUS	Receiver Status word, see <i>Table 182: Receiver Status</i> on page 781
2	AUX1	Auxiliary 1 Status word, see <i>Table 184: Auxiliary 1 Status</i> on page 783
3	AUX2	Auxiliary 2 Status word see <i>Table 185: Auxiliary 2 Status</i> on page 784
4	AUX3	Auxiliary 3 Status word see <i>Table 186: Auxiliary 3 Status</i> on page 786
5	AUX4	Auxiliary 4 Status word see <i>Table 188: Auxiliary 4 Status</i> on page 788

**Table 190: Event Type**

Binary	ASCII	Description
0	CLEAR	Bit was cleared
1	SET	Bit was set

## 3.171 SAFEMODESTATUS

### Safe Mode Status

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides additional information about the state of the receiver in the event that the *Safe Mode* error bit and/or *Reset Loop Detected* status bit are set in the **RXSTATUS** log (see page 777).

The data within this log is set at receiver start up and will not change over time.

For information about *Safe Mode*, see *Safe Mode* in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

**Message ID:** 2060

**Log Type:** Asynch

**Recommended Input:**

```
log SAFEMODESTATUSUSA once
```

**Abbreviated ASCII Example:**

```
#SAFEMODESTATUSUSA,COM1,0,89.0,UNKNOWN,0,0.000,024c0020,8e55,32768;SAFE_MODE_OK,0,"Normal Operation."*29c7d28a
```

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
1	SAFEMODESTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Status	Safe Mode State. See <i>Table 191: Safe Mode States</i> on the next page	Enum	4	H
3	Reset Count	Number of resets since power up or a successful boot	Ulong	4	H+4
4	Description	String for additional information about the Safe Mode State	String	80	H+8
5	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+88
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 191: Safe Mode States

Value	State	Safe Mode Error Bit	Reset Loop Detected Bit	Notes	Recovery Steps
0	SAFE_MODE_OK	0	0	Normal Operation. No reset loop detected.	No action required
1	SAFE_MODE_WARNING	0	1	An unexpected reset was detected. The receiver will operate as normal	No action required
2	SAFE_MODE_DISABLE_SATELLITE_DATA	0	1	Satellite Navigation Data previously saved to NVM is ignored in this state. As the receiver continues to track GNSS satellites, new data will be downloaded. There may be some delay in initial satellite acquisition as this will effectively be a Cold Start, but the receiver will otherwise operate as normal.	No action required
3	SAFE_MODE_DISABLE_NON_COMMUNICATION_NVM	1	1	All data previously saved to NVM that is not related to communication is ignored in this state. Communication ports (COM, USB, ICOM, etc.) will remain in the configuration previously saved by SAVECONFIG allowing the user to take corrective action.	Depending on what NVM data is causing the problem, a <b>FRESET</b> may resolve the issue. If a standard <b>FRESET</b> does not resolve the issue, see the <b>FRESET</b> command on page 171 for other NVM targets that may be causing the issue and could be removed.
4	SAFE_MODE_DISABLE_ALL_NVM	1	1	All data previously saved to NVM is ignored in this state.	See recovery steps for SAFE_MODE_DISABLE_NON_COMMUNICATION_NVM.

Value	State	Safe Mode Error Bit	Reset Loop Detected Bit	Notes	Recovery Steps
5	SAFE_MODE_DISABLE_AUTH	1	1	All data previously saved to NVM and all Auth Codes are ignored in this state.	Use the <b>AUTH REMOVE</b> command to remove the offending Auth Code. The <b>AUTHCODES</b> log (see page 408) can be used to determine what Auth Codes are currently loaded.
6	SAFE_MODE_FAILED	1	1	All data previously saved to NVM and all Auth Codes are ignored in this state.	This state is unexpected. The recovery steps for other states may apply.
7	SAFE_MODE_UNEXPECTED_MAIN_FIRMWARE	1	0 or 1	An error related to main firmware loading occurred.	Reload the main firmware.

## 3.172 SATVIS2

### *Satellite visibility*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains satellite visibility data for all available systems with additional satellite and satellite system information. One log is output for each available satellite system.

1. The SATVIS2 log is meant to provide a brief overview. The satellite positions and velocities used in the computation of this log are based on Almanac orbital parameters, not the higher precision Ephemeris parameters. BeiDou is an exception, it uses ephemeris only.
2. In the SATVIS2 log output, there may be double satellite number entries. These are GLONASS antipodal satellites in the same orbit plane separated by 180 degrees latitude. Refer to the GLONASS section of *An Introduction to GNSS* available on our website at [novatel.com/an-introduction-to-gnss](http://novatel.com/an-introduction-to-gnss).
3. The SATVIS2 log is generated every 10 seconds. If the log is requested at a faster rate than ontime 10, it will be output at the requested rate, but will only be updated every 10 seconds.

**Message ID:** 1043

**Log Type:** Asynch

**Recommended Input:**

```
log satvis2a onchanged
```

**Abbreviated ASCII Example:**

```
<SATVIS2 COM1 6 49.0 FINESTEERING 2073 326280.000 02000000 a867 15761

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SATVIS2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Satellite System	GNSS satellite system identifier. See <i>Table 118: Satellite System</i> on page 561	Enum	4	H
3	sat vis	Is satellite visibility valid? 0 = FALSE 1 = TRUE	Enum	4	H+4
4	almanac flag	Was complete almanac used? 0 = FALSE 1 = TRUE	Enum	4	H+8
5	#sat	Number of satellites with data to follow	Ulong	4	H+12
6	Satellite ID	In binary logs, the satellite ID field is 4 bytes. The 2 lowest order bytes, interpreted as a USHORT, are the system identifier: for instance, the PRN for GPS or the slot for GLONASS. The 2 highest-order bytes are the frequency channel for GLONASS, interpreted as a SHORT and zero for all other systems. In ASCII and abbreviated ASCII logs, the satellite ID field is the system identifier. If the system is GLONASS and the frequency channel is not zero, then the signed channel is appended to the system identifier. For example, slot 13, frequency channel -2 is output as 13-2.  For more information, refer to <i>PRN Numbers</i> on page 48	Ulong	4	H+16

Field	Field type	Description	Format	Binary Bytes	Binary Offset
7	health	Satellite health <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">            Satellite health values may be found in the applicable Interface Control Document for each system.         </div>	Ulong	4	H+20
8	elev	Elevation (degrees)	Double	8	H+24
9	az	Azimuth (degrees)	Double	8	H+32
10	true Doppler	Theoretical Doppler of satellite - the expected Doppler frequency based on a satellite's motion relative to the receiver. It is computed using the satellite's coordinates and velocity along with the receiver's coordinates and velocity (Hz).	Double	8	H+40
11	apparent Doppler	Apparent Doppler for this receiver - the same as Theoretical Doppler above but with clock drift correction added (Hz).	Double	8	H+48
12	Next satellite offset = $H + 16 + (\#sat \times 40)$				
13	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+16+ (#sat x 40)
14	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.173 SATXYZ2

### *Satellite positions in ECEF Cartesian coordinates*

**Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2**

When combined with a RANGE log, this data set contains the decoded satellite information necessary to compute the solution: satellite coordinates (ECEF), satellite clock correction, ionospheric corrections and tropospheric corrections. See the calculation examples in the usage box below. Only those satellites used in the corresponding PSRPOS solution are reported here. See also *Figure 12: The WGS84 ECEF Coordinate System* on page 448.

The position coordinates are provided in the datum configured by the **OUTPUTDATUM** command (see page 246).

**Message ID: 1451**

**Log Type: Synch**

**Recommended Input:**

```
log satxyz2 ontime 1
```

**Abbreviated ASCII Example:**

```

```

The OEM7 family defines ionospheric and tropospheric corrections positively which means that ionospheric and tropospheric corrections are added to the geometric ranges or subtracted from the measured pseudoranges. A positive clock offset indicates the clock is running ahead of the reference time. For example:

$$P = p + pd + c(dT - dt) + d(\text{ion}) + d(\text{trop}) + E_p$$

is equivalent to

$$P - c(dT - dt) - d(\text{ion}) - d(\text{trop}) = p + pd + E_p$$

where

$P$  = measured pseudorange  
 $p$  = geometric range  
 $pd$  = orbit error  
 $dt$  = satellite clock offset  
 $dT$  = receiver clock offset  
 $d(\text{ion})$  = ionospheric delay  
 $d(\text{trop})$  = tropospheric delay  
 $c$  = speed of light  
 $E_p$  = noise and multipath

Note that when dual frequency ionosphere corrections are used, the corrections include receiver biases. Consequently, the correction does not provide a measure of the ionosphere delay in an absolute sense.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SATXYZ2 header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	#sat	Number of satellites to follow	Ulong	4	H
3	System	Satellite system (refer to <i>Table 118: Satellite System</i> on page 561)	Enum	4	H+4
4	Satellite ID	Satellite ID	Ulong	4	H+8
5	X	Satellite X co-ordinates (ECEF,m)	Double	8	H+12
6	Y	Satellite Y co-ordinates (ECEF,m)	Double	8	H+20
7	Z	Satellite Z co-ordinates (ECEF,m)	Double	8	H+28
8	clk corr	Satellite clock correction (m)	Double	8	H+36

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
9	iono delay	Ionosphere delay (m)	Double	8	H+44
10	tropo delay	Troposphere delay (m)	Double	8	H+52
11	Reserved1		Double	8	H+60
12	Reserved2		Double	8	H+68

14	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+(#sat x 72)
15	[CR][LF]	Sentence terminator (ASCII only)			

## 3.174 SAVEDSURVEYPOSITIONS

### *Saved surveyed positions*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7

This log lists the surveyed positions saved on the receiver.

A surveyed position is saved using the **AUTOSURVEY** command (see page 80) or **SURVEYPOSITION** command (see page 351).

**Message ID:** 1951

**Log Type:** Polled

**Recommended Input:**

```
log savedsurveypositions once
```

**Abbreviated ASCII Example:**

```
<SAVEDSURVEYPOSITIONS COM1 0 82.5 FINESTEERING 2003 313938.731 02000008 ddf2
32768
<      3
<      "MN01" 51.000000000000 100.000000000000 150.0000
<      "TST1" 90.000000000000 90.000000000000 90.0000
<      "MON1" 45.000000000000 45.000000000000 45.0000
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SAVEDSURVEY POSITIONS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#Positions	Number of records to follow.	Ulong	4	H
3	Position ID	ID for the saved position. <b>Note:</b> In the Binary case, the ID string must be null terminated and additional bytes of padding must be added to make the total length of the field 8 bytes.	String	8	H+4
4	Latitude	Latitude of the position (-90 to 90 degrees) where a '-' sign denotes south and a '+' sign denotes north	Double	8	H+12
5	Longitude	Longitude of the position (-360 to 360 degrees) where a '-' sign denotes west and a '+' sign denotes east	Double	8	H+20
6	Height	Mean Sea Level height of the position in meters	Double	8	H+28
7	Next reading offset = H+4+(#Positions * 32)				

---

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4+ (#Positions * 32)
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.175 SBAS0

### *Do not use for safety applications*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This message specifies the PRN if GEO transmitting SBAS corrections is operating in test mode, and should not be used for safety applications for a period of time outlined in the SBAS signal specification.

The GEO transmitting SBAS corrections is operating in test mode, and should not be used for safety-of-life applications.

See how the SBAS0 message relates to the SBAS testing modes in the **SBASCONTROL** command on page 305.

**Message ID:** 976

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS0a onchanged
```

**ASCII Example:**

```
#SBAS0A, COM1, 0, 72.5, SATTIME, 2073, 327283.000, 1a000000, 5a84, 15761;130*8390deb3
```

Although the SBAS was designed for aviation users, it supports a wide variety of non-aviation uses including agriculture, surveying, recreation, and surface transportation.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS0 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN message - also PRN not to use	Ulong	4	H
3	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4
4	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

### 3.176 SBAS1

#### ***PRN mask assignments***

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The PRN mask is given in SBAS1. The transition of the PRN mask to a new one (which will be infrequent) is controlled with the 2-bit IODP, which sequences to a number between 0 and 3. The same IODP appears in the applicable SBAS2, SBAS3, SBAS4, SBAS5, SBAS7, SBAS24 and SBAS25 messages (SBAS32, SBAS33, SBAS34, SBAS35 and SBAS45). This transition would probably only occur when a new satellite is launched or when a satellite fails and is taken out of service permanently. A degraded satellite may be flagged as a “do not use” satellite temporarily.

**Message ID:** 977

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS1a onchanged
```

**ASCII Example:**

```
#SBAS1A,COM1,0,24.5,SATTIME,1337,415802.000,02000000,5955,1984;134,ffeffffe0000  
000000000000000000000040040000000000000000000000,2*3633cf7b
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS1 message can be logged to view the data breakdown of SBAS frame 1 which contains information about the PRN mask assignment.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS1 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	mask	PRN bit mask	Uchar [27]	28 <sup>1</sup>	H+4
4	iodp	Issue of PRN mask data	Ulong	4	H+32
5	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+36
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>In the binary log case, an additional 1 byte of padding is added to maintain 4-byte alignment.

## 3.177 SBAS2

### *Fast correction slots 0-12*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS2 are fast corrections for slots 0-12 in the mask of SBAS1. This message may or may not come when SBAS is in testing mode (see the **SBASCONTROL** command on page 305 for details).

**Message ID:** 982

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS2a onchanged
```

**ASCII Example:**

```
#SBAS2A,COM1,0,29.0,SATTIME,1337,415925.000,02000000,e194,1984;134,2,2,3,-3,5,
1,2047,-2,2047,2047,2047,2047,2047,-3,2,5,11,7,8,14,8,14,14,14,14,14,6,12
*8d8d2e1c
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS2 message can be logged to view the data breakdown of SBAS frame 2 which contains information about fast correction slots 0-12.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS2 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H

11	15.0	20.7870
12	50.0	230.9661
13	150.0	2078.695
14	Not Monitored	Not Monitored
15	Do Not Use	Do Not Use

<sup>1</sup>The s2UDRE broadcast in SBAS2, SBAS3, SBAS4, SBAS5, SBAS6 and SBAS24 applies at a time prior to or at the time of applicability of the associated corrections.

## 3.178 SBAS3

### *Fast corrections slots 13-25*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS3 are fast corrections for slots 13-25 in the mask of SBAS1.

**Message ID:** 987

**Log Type:** Asynch

**Recommended Input:**

```
log sbas3a onchanged
```

**ASCII Example:**

```
#SBAS3A,COM1,0,17.0,SATTIME,1337,415990.000,02000000,bff5,1984;134,1,2,2047,0,

## 3.179 SBAS4

### *Fast correction slots 26-38*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS4 are fast corrections for slots 26-38 in the mask of SBAS1.

**Message ID:** 992

**Log Type:** Asynch

**Recommended Input:**

```
log sbas4a onchanged
```

**ASCII Example:**

```
#SBAS4A,COM1,0,58.0,SATTIME,1093,163399.000,02000020,b4b0,209;122,0,3,2047,3,-1,2047,2047,2047,-3,-1,5,3,3,2047,2,14,3,3,14,14,14,6,3,4,5,4,14,3*2e0894b1
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS4 message can be logged to view the data breakdown of SBAS frame 4 which contains information about fast correction slots 26-38.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS4 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	iodf	Issue of fast corrections data	Ulong	4	H+4
4	iodp	Issue of PRN mask data	Ulong	4	H+8

Field	Field type	Description	Format	Binary Bytes	Binary Offset
5	prc26	prc(i): Fast corrections (-2048 to +2047) for the PRN in slot i (i = 26-38)	Long	4	H+12
6	prc27		Long	4	H+16
7	prc28		Long	4	H+20

32	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.180 SBAS5

### *Fast correction slots 39-50*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS5 are fast corrections for slots 39-50 in the mask of SBAS1.

**Message ID:** 994

**Log Type:** Asynch

**Recommended Input:**

```
log sbas5a onchanged
```

**ASCII Example:**

```
#SBAS5A,COM1,0,72.5,SATTIME,1093,161480.000,02040020,31d4,209;122,1,3,-7,2047,
2047,2047,-4,2047,2047,2047,9,2047,2047,-3,-2,11,14,14,14,4,14,14,14,5,14,14,4,
2*2bf0109b
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS5 message can be logged to view the data breakdown of SBAS frame 5 which contains information about fast correction slots 39-50.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS5 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	iodf	Issue of fast corrections data	Ulong	4	H+4
4	iodp	Issue of PRN mask data	Ulong	4	H+8

Field	Field type	Description	Format	Binary Bytes	Binary Offset
5	prc39	prc(i):  Fast corrections (-2048 to +2047) for the PRN in slot i (i = 39-50)	Long	4	H+12
6	prc40		Long	4	H+16
7	prc41		Long	4	H+20
8	prc42		Long	4	H+24
9	prc43		Long	4	H+28
10	prc44		Long	4	H+32
11	prc45		Long	4	H+36
12	prc46		Long	4	H+40
13	prc47		Long	4	H+44
14	prc48		Long	4	H+48
15	prc49		Long	4	H+52
16	prc50		Long	4	H+56
17	prc51 (Invalid, do not use)		Long	4	H+60
18	udre39	udre(i):  User differential range error indicator for the PRN in slot i (i = 39-50)  See Table 192: Evaluation of UDREI on page 807 for scaling information.	Ulong	4	H+64
19	udre40		Ulong	4	H+68
20	udre41		Ulong	4	H+72
21	udre42		Ulong	4	H+76
22	udre43		Ulong	4	H+80
23	udre44		Ulong	4	H+84
24	udre45		Ulong	4	H+88
25	udre46		Ulong	4	H+92
26	udre47		Ulong	4	H+96
27	udre48		Ulong	4	H+100
28	udre49		Ulong	4	H+104
29	udre50		Ulong	4	H+108
30	udre51 (Invalid, do not use)		Ulong	4	H+112
31	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+116
32	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.181 SBAS6

### *Integrity message*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS6 is the integrity information message. Each message includes an IODF for each fast corrections message. The  $\sigma^2_{UDRE}$  information for each block of satellites applies to the fast corrections with the corresponding IODF.

**Message ID:** 995

**Log Type:** Asynch

**Recommended Input:**

```
log sbas6a onchanged
```

**ASCII Example:**

```
#SBAS6A,COM1,0,57.5,SATTIME,1093,273317.000,02000020,526a,209;122,3,3,3,3,9,14,
14,2,3,10,2,14,14,3,14,14,5,14,14,7,14,14,14,14,14,14,3,3,14,14,14,14,3,15,11,1
1,15,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0*925a2a9b
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS6 message can be logged to view the data breakdown of SBAS frame 6 which contains information about the integrity message.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS6 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	iodf2	Issue of fast corrections data	Ulong	4	H+4
4	iodf3	Issue of fast corrections data	Ulong	4	H+8
5	iodf4	Issue of fast corrections data	Ulong	4	H+12
6	iodf5	Issue of fast corrections data	Ulong	4	H+16
7	udre0	udre(i): User differential range error indicator for the PRN in slot i (i = 0-50) See <i>Table 192: Evaluation of UDREI</i> on page 807 for scaling information.	Ulong	4	H+20
8	udre1		Ulong	4	H+24
9	udre2		Ulong	4	H+28

60	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.182 SBAS7

### *Fast correction degradation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The SBAS7 message specifies the applicable IODP, system latency time and fast degradation factor indicator for computing the degradation of fast and long term corrections.

**Message ID:** 996

**Log Type:** Asynch

**Recommended Input:**

```
log sbas7a onchanged
```

**ASCII Example:**

```
#SBAS7A,COM1,0,36.5,SATTIME,1337,416367.000,02000000,12e3,1984;122,1,2,0,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,15,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0*827a7364
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS7 message can be logged to view the data breakdown of SBAS frame 7 which contains information about fast correction degradation.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS7 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	latency	System latency (s)	Ulong	4	H+4
4	iodp	Issue of PRN mask data	Ulong	4	H+8
5	spare bits	Unused spare bits	Ulong	4	H+12

59	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.183 SBAS9

### *GEO navigation message*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS9 provides the GEO navigation message representing the position, velocity and acceleration of the geostationary satellite, in ECEF coordinates and its apparent clock time and frequency offsets.

Also included is the time of applicability, an Issue of Data (IOD) and an accuracy exponent (URA) representing the estimated accuracy of the message. The time offset and time drift are with respect to SBAS Network Time. Their combined effect is added to the estimate of the satellite's transmit time.

**Message ID:** 997

**Log Type:** Asynch

**Recommended Input:**

```
log sbas9a onchanged
```

**ASCII Example:**

```
#SBAS9A,COM1,0,38.0,SATTIME,1337,416426.000,02000000,b580,1984;122,175,70848,2,24802064.1600,-34087313.9200,-33823.2000,1.591250000,0.107500000,0.6080000,-0.0000750,-0.0001125,0.000187500,-2.235174179e-08,9.094947018e-12*636051d2
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS9 message can be logged to view the data breakdown of SBAS frame 9 which contains the GEO navigation message.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS9 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	iodn	Issue of GEO navigation data	Ulong	4	H+4
4	t <sub>0</sub>	Time of applicability	Ulong	4	H+8
5	ura	URA value	Ulong	4	H+12
6	x	ECEF x coordinate (m)	Double	8	H+16
7	y	ECEF y coordinate (m)	Double	8	H+24
8	z	ECEF z coordinate (m)	Double	8	H+32
9	xvel	X rate of change (m/s)	Double	8	H+40
10	yvel	Y rate of change (m/s)	Double	8	H+48
11	zvel	Z rate of change (m/s)	Double	8	H+56

Field	Field type	Description	Format	Binary Bytes	Binary Offset
12	xaccel	X rate of rate change (m/s <sup>2</sup> )	Double	8	H+64
13	yaccel	Y rate of rate change (m/s <sup>2</sup> )	Double	8	H+72
14	zaccel	Z rate of rate change (m/s <sup>2</sup> )	Double	8	H+80
15	a <sub>f0</sub>	Time offset (s)	Double	8	H+88
16	a <sub>f1</sub>	Time drift (s)	Double	8	H+96
17	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+104
18	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.184 SBAS10

### *Degradation factor*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The fast corrections, long term corrections and ionospheric corrections are all provided in the SBAS10 message.

**Message ID:** 978

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS10a onchanged
```

**ASCII Example:**

```
#SBAS10A,COM1,0,35.5,SATTIME,1337,416469.000,02000000,c305,1984;122,54,38,76,256,152,100,311,83,256,6,0,300,292,0,1,000000000000000000000000*8884d248
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS10 message can be logged to view the data breakdown of SBAS frame 10 which contains information about degradation factors.

Field	Field type	Description	Format	Binary Bytes	Binary Offset	Scaling
1	SBAS10 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0	-
2	prn	Source PRN of message	Ulong	4	H	-
3	b <sub>rcc</sub>	Estimated noise and round off error parameter	Ulong	4	H+4	0.002
4	c <sub>ltc_lsb</sub>	Maximum round off due to the least significant bit (lsb) of the orbital clock	Ulong	4	H+8	0.002
5	c <sub>ltc_vl</sub>	Velocity error bound	Ulong	4	H+12	0.00005
6	i <sub>ltc_vl</sub>	Update interval for v=1 long term	Ulong	4	H+16	-
7	c <sub>ltc_v0</sub>	Bound on update delta	Ulong	4	H+20	0.002
8	i <sub>ltc_v1</sub>	Minimum update interval v = 0	Ulong	4	H+24	-
9	c <sub>geo_lsb</sub>	Maximum round off due to the lsb of the orbital clock	Ulong	4	H+28	0.0005
10	c <sub>geo_v</sub>	Velocity error bound	Ulong	4	H+32	0.00005
11	i <sub>geo</sub>	Update interval for GEO navigation message	Ulong	4	H+36	-
12	c <sub>er</sub>	Degradation parameter	Ulong	4	H+40	0.5

Field	Field type	Description	Format	Binary Bytes	Binary Offset	Scaling
13	$c_{iono\_step}$	Bound on ionospheric grid delay difference	Ulong	4	H+44	0.001
14	$i_{iono}$	Minimum ionospheric update interval	Ulong	4	H+48	-
15	$c_{iono\_ramp}$	Rate of ionospheric corrections change	Ulong	4	H+52	0.000005
16	$rss_{udre}$	User differential range error flag	Ulong	4	H+56	-
17	$rss_{iono}$	Root sum square flag	Ulong	4	H+60	-
18	spare bits	Spare 88 bits, possibly GLONASS	Hex [11]	11	H+64	-
19	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+75	-
20	[CR][LF]	Sentence terminator (ASCII only)	-	-	-	-

## 3.185 SBAS12

### *SBAS network time and UTC*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS12 contains information bits for the UTC parameters and UTC time standard from which an offset is determined. The UTC parameters correlate UTC time with the SBAS network time rather than with GPS reference time.

**Message ID:** 979

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS12a onchanged
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS12 message can be logged to view the data breakdown of SBAS frame 12 which contains information about time parameters.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS12 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	A <sub>1</sub>	Time drift (s/s)	Double	8	H+4
4	A <sub>0</sub>	Time offset (s)	Double	8	H+12
5	seconds	Seconds into the week (s)	Ulong	4	H+20
6	week	Week number	Ushort	2	H+24
7	dt <sub>ls</sub>	Delta time due to leap seconds	Short	2	H+26
8	wn <sub>lsf</sub>	Week number, leap second future	Ushort	2	H+28
9	dn	Day of the week (the range is 1 to 7 where Sunday = 1 and Saturday = 7)	Ushort	2	H+30
10	dt <sub>lsf</sub>	Delta time, leap second future	Ushort	2	H+32
11	utc id	UTC type identifier	Ushort	2	H+34
12	gpstow	GPS reference time of the week	Ulong	4	H+36
13	gpswn	GPS de-modulo week number	Ulong	4	H+40

Field	Field type	Description	Format	Binary Bytes	Binary Offset
14	glo indicator	Is GLONASS information present? 0 = FALSE 1 = TRUE	Enum	4	H+44
15		Reserved array of hexabytes for GLONASS	Char [10]	12 <sup>1</sup>	H+48
16	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+60
17	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

---

<sup>1</sup>In the binary log case, an additional 2 bytes of padding are added to maintain 4-byte alignment.

## 3.186 SBAS17

### *GEO Almanac message*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

Almanacs for all GEOs are broadcast periodically to alert you of their existence, location, the general service provided, status and health.

Unused almanacs have a PRN number of 0 and should be ignored, see *ASCII Example* below.

**Message ID:** 980

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS17a onchanged
```

**ASCII Example:**

```
#SBAS17A, COM1, 0, 84.5, SATTIME, 1610, 514149.000, 02000000, 896c, 39061;135, 3, 0, 135,
0, -11536200, -40536600, -260000, 0, 0, 0, 0, 138, 0, -12521600, -40258400,
0, 0, 0, 0, 0, 133, 0, -5551000, -41774200, -1248000, 0, 0, 120, 82112*2be5146f
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS17 message can be logged to view the data breakdown of SBAS frame 17 which contains GEO almanacs.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS17 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	#ents	Number of almanac entries with information to follow	Ulong	4	H+4
4	data id	Data ID type	Ushort	2	H+8
5	entry prn	PRN for this entry	Ushort	2	H+10
6	health	Health bits	Ushort	4 <sup>1</sup>	H+12
7	x	ECEF x coordinate (m)	Long	4	H+16
8	y	ECEF y coordinate (m)	Long	4	H+20

<sup>1</sup>In the binary log case, an additional 2 bytes of padding is added to maintain 4-byte alignment.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
9	z	ECEF z coordinate (m)	Long	4	H+24
10	x vel	X rate of change (m/s)	Long	4	H+28
11	y vel	Y rate of change (m/s)	Long	4	H+32
12	z vel	Z rate of change (m/s)	Long	4	H+36
13...	Next entry = H+8+ (#ents x 32)				
14	t0	Time of day in seconds (0 to 86336) Scaling = 64	Ulong	4	H+8+ (#ents x 32)
15	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+12+ (#ents x 32)
16	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.187 SBAS18

### *IGP mask*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The ionospheric delay corrections are broadcast as vertical delay estimates, at specified ionospheric grid points (IGPs), applicable to a signal on L1. The predefined IGPs are contained in 11 bands (numbered 0 to 10). Bands 0-8 are vertical bands on a Mercator projection map and bands 9-10 are horizontal bands on a Mercator projection map. Since it is impossible to broadcast IGP delays for all possible locations, a mask is broadcast to define the IGP locations providing the most efficient model of the ionosphere at the time.

**Message ID:** 981

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS18a onchanged
```

**ASCII Example:**

```
#SBAS18A,COM1,0,33.0,SATTIME,1337,417074.000,02000000,f2c0,1984;122,4,2,2,0000fc0007fc0003ff0000ff80007fe0007fe0003ff0000ff80,0*b1ed353e
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS18 message can be logged to view the data breakdown of SBAS frame 18 which contains information about ionospheric grid points.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS18 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	#bands	Number of bands broadcast	Ulong	4	H+4
4	band num	Specific band number that identifies which of the 11 IGP bands the data belongs to	Ulong	4	H+8
5	iodi	Issue of ionospheric data	Ulong	4	H+12
6	igp mask	IGP mask	Uchar [26]	28 <sup>1</sup>	H+16
7	spare bit	One spare bit	Ulong	4	H+44
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+48
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>In the binary log case, an additional 2 bytes of padding are added to maintain 4-byte alignment.

## 3.188 SBAS24

### *Mixed fast/slow corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

If there are 6 or fewer satellites in a block, they may be placed in this mixed correction message. There is a fast data set for each satellite and a UDRE indicator. Each message also contains an IODP indicating the associated PRN mask.

The fast correction (PRC) has a valid range of -2048 to +2047. If the range is exceeded, a don't use indication is inserted into the user differential range error indicator (UDREI) field, see *Table 192: Evaluation of UDREI* on page 807. You should ignore extra data sets not represented in the PRN mask.

The time of applicability (T0) of the PRC is the start of the epoch of the WNT second that is coincident with the transmission at the GEO satellite of the first bit of the message block.

**Message ID:** 983

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS24a onchanged
```

**ASCII Example:**

```
#SBAS24A, COM1, 0, 34.0, SATTIME, 1337, 417108.000, 02000000, 0a33, 1984;134, 2047, 2047,
2047, 2047, -1, -2, 14, 14, 14, 14, 11, 14, 2, 2, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0
*76ff954b
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS24 message can be logged to view the data breakdown of SBAS frame 24 which contains mixed fast/slow corrections.

Field	Field type	Description	Format	Binary Bytes	Binary Offset	Scaling
1	SBAS24 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0	-
2	prn	Source PRN of message	Ulong	4	H	-

31	da <sub>f1</sub>	Delta a <sub>f1</sub> clock offset	Long	4	H+116	2 <sup>-39</sup>
32	t <sub>0</sub>	Applicable time of day	Ulong	4	H+120	16
33	iodp	Issue of PRN mask data	Ulong	4	H+124	-
34	corr spare	Spare value when velocity code is equal to 0	Ulong	4	H+128	-

---

Field	Field type	Description	Format	Binary Bytes	Binary Offset	Scaling
35	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+132	-
36	[CR][LF]	Sentence terminator (ASCII only)	-	-	-	-

## 3.189 SBAS25

### *Long term slow satellite corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS25 provides error estimates for slow varying satellite ephemeris and clock errors with respect to WGS-84 ECEF coordinates.

**Message ID:** 984

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS25a onchanged
```

**ASCII Example:**

```
#SBAS25A,COM1,0,37.5,SATTIME,1337,417193.000,02000000,b8ff,1984;134,1,19,25,-1,-3,0,-15,0,0,0,1,-1,-2,4465,2,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0*81685317
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS25 message can be logged to view the data breakdown of SBAS frame 25 which contains long term slow satellite corrections.

Field	Field type	Description	Format	Binary Bytes	Binary Offset	Scaling
1	SBAS25 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0	-

36	[CR][LF]	Sentence terminator (ASCII only)	-	-	-	-

## 3.190 SBAS26

### *Ionospheric delay corrections*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS26 provides vertical delays (relative to an L1 signal) and their accuracy at geographically defined IGP's identified by the BAND NUMBER and IGP number. Each message contains a band number and a block ID, which indicates the location of the IGP's in the respective band mask.

**Message ID:** 985

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS26a onchanged
```

**ASCII Example:**

```
#SBAS26A,COM1,0,38.0,SATTIME,1337,417243.000,02000000,ec70,1984;134,1,2,15,27,1
1,25,11,23,11,19,11,16,11,16,12,15,13,16,13,29,14,30,13,27,11,27,11,24,11,19,11
,16,12,2,0*3b6d6806
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS26 message can be logged to view the data breakdown of SBAS frame 26 which contains ionospheric delay corrections

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS26 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	band num	Band number	Ulong	4	H+4
4	block id	Block ID	Ulong	4	H+8
5	#pts	Number of grid points with information to follow	Ulong	4	H+12
6	igp <sub>vde</sub>	IGP vertical delay estimates Scaling = 0.125	Ulong	4	H+16
7	givei	Grid ionospheric vertical error indicator	Ulong	4	H+20
8...	Next #pts entry = H + 16 + (#pts x 8)				
9	iodi	Issue of data - ionosphere	Ulong	4	H+16+ (#pts x 8)

---

Field	Field type	Description	Format	Binary Bytes	Binary Offset
10	spare	7 spare bits	Ulong	4 <sup>1</sup>	H+20+ (#pts x 8)
11	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+24+ (#pts x 8)
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

---

<sup>1</sup>In the binary case, additional bytes of padding are added after this field to maintain 4-byte alignment for the fields that follow.

## 3.191 SBAS27

### *SBAS service message*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

SBAS27 messages apply only to the service provider transmitting the message. The number of service messages indicates the total number of unique SBAS27 messages for the current IODS. Each unique message for that IODS includes a sequential message number. The IODS is incremented in all messages, each time that any parameter in any SBAS27 message is changed.

**Message ID:** 986

**Log Type:** Asynch

**Recommended Input:**

```
log SBAS27a onchanged
```

Each raw SBAS frame gives data for a specific frame decoder number. The SBAS27 message can be logged to view the data breakdown of SBAS frame 27 which contains information about SBAS service messages.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	SBAS27 header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	prn	Source PRN of message	Ulong	4	H
3	iods	Issue of slow corrections data	Ulong	4	H+4
4	#messages	Low-by-one count of messages	Ulong	4	H+8
5	message num	Low-by-one message number	Ulong	4	H+12
6	priority code	Priority code	Ulong	4	H+16
7	dudre inside	Delta user differential range error – inside	Ulong	4	H+20
8	dudre outside	Delta user differential range error – outside	Ulong	4	H+24
9...	#reg	Number of regions with information to follow	Ulong	4	H+28
10	lat1	Coordinate 1 latitude	Long	4	H+32
11	lon1	Coordinate 1 longitude	Long	4	H+36
12	lat2	Coordinate 2 latitude	Long	4	H+40
13	lon2	Coordinate 2 longitude	Long	4	H+44

Field	Field type	Description	Format	Binary Bytes	Binary Offset
14	shape	Shape where: 0 = triangle, 1 = square	Ulong	4	H+48
15	Next #reg entry = H+32+(#reg x 20)				
16	Reserved		Ulong	4	H+32+ (#reg x 20)
17	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+36+ (#reg x 20)
18	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.192 SBASALMANAC

### *SBAS Almanac collection*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains a collection of all current SBAS almanacs that have been decoded by the receiver and may contain almanac data for multiple PRNs. The SBASALMANAC log is populated by the GEO Almanac Message Type 17 which is available in the **SBAS17** log (see page 826). These PRNs are broken out into individual SBAS almanac entries for this message and output individually. If multiple SBAS subsystems (e.g., WAAS, EGNOS, GAGAN, MSAS) are tracked, this message will include almanac data collected from each with the subsystem identified in each message entry. The almanac data contains all of the information required to compute the satellite position as well as health and status information.

The OEM7 family of receivers automatically save almanacs in their Non-Volatile Memory (NVM), so creating an almanac boot file is not necessary.

**Message ID:** 1425

**Log Type:** Asynch

**Recommended Input:**

Log SBASALMANACA onchanged

**ASCII Example:**

```
#SBASALMANACA,COM1,2,80.0,SATTIME,1672,411186.000,02000020,84d8,43119;133,WAAS,
65600,0,0,-5571800,-41758600,-1456000,0,0,120*22da17e8

#SBASALMANACA,COM1,1,80.0,SATTIME,1672,411186.000,02000020,84d8,43119;135,WAAS,
65600,0,0,-28758600,-30825600,0,0,0,0*dd122ca1

#SBASALMANACA,COM1,0,80.0,SATTIME,1672,411186.000,02000020,84d8,43119;138,WAAS,
65600,0,0,-12547600,-40248000,0,0,0,0*89c6c51c
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SBASALMANAC Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Satellite ID	Satellite ID	Ulong	4	H
3	Variant	System variant (refer to <i>Table 193: SBAS Subsystem Types</i> on the next page)	Enum	4	H + 4
4	Time	Time of day (s)	Ulong	4	H + 8
5	Data ID	Data identification	Ushort	2	H + 12
6	Health	Satellite health	Ushort	2	H + 14
7	X	ECEF X coordinate (m)	Long	4	H + 16
8	Y	ECEF Y coordinate (m)	Long	4	H + 20

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
9	Z	ECEF Z coordinate (m)	Long	4	H + 24
10	X Velocity	X rate of change (m/s)	Long	4	H + 28
11	Y Velocity	Y rate of change (m/s)	Long	4	H + 32
12	Z Velocity	Z rate of change (m/s)	Long	4	H + 36
13	CRC	32-bit CRC (ASCII and binary only)	Ulong	4	H + 40
14	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 193: SBAS Subsystem Types

ASCII	Binary	Description
NONE	0	No system
UNKNOWN	1	Unknown system
WAAS	2	WAAS system
EGNOS	3	EGNOS system
MSAS	4	MSAS system
GAGAN	5	GAGAN system
QZSS	7	QZSS System

### 3.193 SOFTLOADSTATUS

*Describes the status of the SoftLoad process*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log describes the status of the SoftLoad process.

Status values  $\geq 16$  (ERROR) indicate that an error has occurred during the loading process. Status  $< 16$  (ERROR) are part of normal SoftLoad operation.

**Message ID:** 1235

**Log Type:** Asynch

**Recommended Input:**

```
log softloadstatusa onchanged
```

**ASCII Example:**

```
#SOFTLOADSTATUSA, COM1, 0, 97.5, UNKNOWN, 0, 0.113, 024c0001, 2d64, 10481;NOT_
STARTED*827fdc04
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SOFTLOADSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	status	Status of the SoftLoad process see <i>Table 194: SoftLoad Status Type</i> below	Enum	4	H
3	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4
4	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 194: SoftLoad Status Type**

Value	Name	Description
1	NOT_STARTED	SoftLoad process has not begun.
2	READY_FOR_SETUP	SoftLoad process is ready to receive setup information in the form of the <b>SOFTLOADSETUP</b> command or <b>SOFTLOADSREC</b> command with S0 records. Once sufficient setup data has been sent, the process is also ready for the <b>SOFTLOADDATA</b> command.
3	READY_FOR_DATA	SoftLoad process is ready to receive data in the form of the <b>SOFTLOADDATA</b> command or <b>SOFTLOADSREC</b> command with S3 records. Once all data has been sent, send the <b>SOFTLOADCOMMIT</b> command.

Value	Name	Description
4	DATA_VERIFIED	SoftLoad data has passed CRC. This status occurs after a <b>SOFTLOADCOMMIT</b> command.
5	WRITING_FLASH	SoftLoad data is being written to flash. This status occurs after a <b>SOFTLOADCOMMIT</b> command. During a firmware upload, the receiver may remain in this state for 300 seconds or longer.
6	WROTE_FLASH	SoftLoad data has been written to flash.
7	WROTE_AUTHCODE	The embedded AuthCode was successfully written.
8	COMPLETE	SoftLoad process has completed. The next step is to send the <b>RESET</b> command to reset the receiver.
9	VERIFYING_DATA	SoftLoad is verifying the downloaded image.
10	COPIED_SIGNATURE_AUTH	Signature AuthCodes have been copied from the current firmware to the downloaded firmware.
11	WROTE_TRANSACTION_TABLE	The downloaded firmware has been activated and will be executed if the receiver is reset. This status is effectively identical to COMPLETE.
13	PROCESSING_FILE	The <b>SOFTLOADFILE</b> command is processing the firmware file.
16	ERROR	Indicates an internal error in the SoftLoad process. This error is not expected to occur. Contact NovAtel Customer Support for assistance.
17	RESET_ERROR	Error resetting SoftLoad. Reset the receiver and restart the SoftLoad process.
18	BAD_SRECORD	A bad S Record was received. Ensure that S Records are enclosed in double quotes within the <b>SOFTLOADSREC</b> command.
19	BAD_PLATFORM	This data cannot be loaded onto this platform. Ensure that the correct *.shex file for the platform is being used.
20	BAD_MODULE	This module cannot be loaded with SoftLoad. This file must be loaded using WinLoad or a similar loader.
21	BAD_AUTHCODE	Bad AuthCode received for this PSN.
22	NOT_READY_FOR_SETUP	A <b>SOFTLOADSETUP</b> command was entered before a <b>SOFTLOADRESET</b> command or after a <b>SOFTLOADDATA</b> command.
23	NO_MODULE	No data type was entered before a <b>SOFTLOADDATA</b> command was received. Set the data type using the <b>SOFTLOADSETUP</b> command or <b>SOFTLOADSREC</b> command with an "S0~T~" S Record.

Value	Name	Description
24	NO_PLATFORM	No platform was entered before a <b>SOFTLOADDATA</b> command was received. Set the platform using the <b>SOFTLOADSETUP</b> command or <b>SOFTLOADSREC</b> command with an "S0~P~" S Record.
25	NOT_READY_FOR_DATA	A <b>SOFTLOADDATA</b> command was received but the receiver was not ready for it.
26	MODULE_MISMATCH	The SoftLoad data module was changed in the middle of loading. Restart the SoftLoad process using the <b>SOFTLOADRESET</b> command.
27	OUT_OF_MEMORY	SoftLoad has run out of RAM to store the incoming data. Reset the receiver and restart the SoftLoad process.
28	DATA_OVERLAP	SoftLoad data has overlapped. Ensure that the correct address and length is set in the <b>SOFTLOADDATA</b> command or <b>SOFTLOADSREC</b> command.
29	BAD_IMAGE_CRC	CRC of the downloaded image has failed. Ensure that all content from the *.shex file has been successfully downloaded.
30	IMAGE_OVERSIZE	The downloaded image is too big for the intended data module.
31	AUTHCODE_WRITE_ERROR	An error occurred when writing the embedded AuthCode to flash.
32	BAD_FLASH_ERASE	Erasing of the flash failed. This could indicate a failure in the flash hardware.
33	BAD_FLASH_WRITE	Writing to the flash failed. This could indicate a failure in the flash hardware.
34	TIMEOUT	SoftLoad time out has occurred.
35	INCOMPATIBLE_FLASH	Application image that does not support the onboard flash rejected.

## 3.194 SOURCETABLE

### *NTRIP source table entries*

**Platform:** OEM729, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-W, SMART7-I

This log outputs the NTRIP source table entries from the NTRIP caster set by the **NTRIPSOURCETABLE** command (see page 243). The entry data field in the first entry is always the header of the retrieved SOURCETABLE. The entry data field in the last entry is always a string "ENDSOURCETABLE" which indicates the end of the source table. Entries in between these fields are the real SOURCETABLE entries.

**Message ID:** 1344

**Log Type:** Polled

**Recommended Input:**

```
log sourcetablea once
```

**ASCII Example:**

```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SOURCETABLE header	Log header. See <i>Messages</i> on page 30 for more information.		H	0

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
2	endpoint	NTRIPCASTER Endpoint	String with varied length up to 80 bytes	a <sup>1</sup>	H
3	Reserved1	reserved	Ulong	4	H+a
4	Reserved2	reserved	Ulong	4	H+a+4
5	Entry data	Source table entry data	String with varied length up to 512 bytes	b <sup>1</sup>	H+a+8
6	xxxx	32-bit CRC (ASCII and binary only)	Ulong	4	H+a+b+8
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

---

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

## 3.195 TECTONICSCOMPENSATION

### *Tectonics Compensation status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log shows the status of the tectonics compensation.

**Message ID:** 2291

**Log Type:** Asynch

**Recommended Input:**

```
log tectonicscompensationa onchanged
```

**ASCII Example:**

```
#TECTONICSCOMPENSATIONA,COM1,0,74.0,FINESTEERING,2044,511461.010,02000020,3af4,15427;AVAILABLE,"North America",-0.018,-0.000,-0.006*e85af7bf
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	TECTONICS COMPENSATION header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	status	Status of plate tectonics compensation. See <i>Table 195: Tectonics Compensation Status</i> below.	Enum	4	H
3	name	Name of the plate that is being used for determining station velocities.	Char (32)	Variable	H+4
4	xvel	Station velocities for the location of the receiver (meters/year)	Float	4	Variable
5	yvel		Float	4	Variable
6	zvel		Float	4	Variable
7	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	Variable
8	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

**Table 195: Tectonics Compensation Status**

Binary	ASCII	Description
0	UNAVAILABLE	Tectonics compensation is not available.
1	AVAILABLE	Tectonics compensation is available.
2	WARNING	The receiver is either close to a plate boundary or inside a region where the tectonics compensation is not well modeled.

---

Binary	ASCII	Description
4	OFF_PLATE	The receiver has moved from the plate that was initially selected. The receiver will not change the plate to avoid discontinuities in the positions.

## 3.196 TERRASTARINFO

### *TerraStar subscription information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains details on the TerraStar subscription.

**Message ID:** 1719

**Log Type:** Asynch

**Recommended Input:**

```
log terrastarinfoa onchanged
```

**ASCII Example:**

```
#TERRASTARINFOA,COM1,0,78.0,FINESTEERING,2050,426971.997,02000000,91ea,14517;"QW503:1904:5936",TERM,00000700,120,2019,0,NEARSHORE,0.00000,0.00000,0*c930f2bd
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	TERRASTAR INFO header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	PAC	Product activation code	Char [16]	16	H
3	Type	Subscription type (see <i>Table 196: TerraStar Subscription Type</i> on the next page)	Enum	4	H+16
4	Subscription permissions	Services permitted by the subscription (see <i>Table 197: TerraStar Subscription Details Mask</i> on the next page) <b>Note:</b> Bits in the Reserved areas of this field may be set, but the Reserved bits should be ignored. A receiver can have only one active subscription at a time but a subscription can enable multiple services or bits. For example, "00000700" indicates the receiver has a TerraStar-C subscription though TerraStar-L is also allowed.	Hex	4	H+20
5	Service End Day	Last day of the year for which service is available. Service expires at the end of this UTC day. For example, if the Service End Year and Day are 2019 and 15, respectively, then the service will expire on January 15, 2019 at 24:00 UTC.	Ulong	4	H+24
6	Service End Year	Year that subscription ends	Ulong	4	H+28
7	Reserved		Ulong	4	H+32

Field	Field type	Description	Format	Binary Bytes	Binary Offset
8	Region restriction	For region restricted subscriptions, the type of region restriction (see <i>Table 198: TerraStar Region Restriction</i> on the next page)	Enum	4	H+36
9	Center point latitude	For local area subscriptions, the center point latitude (degrees)	Float	4	H+40
10	Center point longitude	For local area subscriptions, the center point longitude (degrees)	Float	4	H+44
11	Radius	For local area subscriptions, the maximum permitted distance from center point (kilometers)	Ulong	4	H+48
12	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+52
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 196: TerraStar Subscription Type**

ASCII	Binary	Description
UNASSIGNED	0	Decoder has not had an assigned operating mode
TERM	1	Term subscription
MODEL	5	Receiver is operating with an RTK assist enabled model and there is not an active TerraStar subscription installed
BUBBLE	100	Receiver is operating in a TerraStar-permitted subscription-free bubble
INCOMPATIBLE_SUBSCRIPTION	104	Subscription is incompatible with this version of firmware

**Table 197: TerraStar Subscription Details Mask**

Bit	Mask	Description
0-8	0x000001FF	Reserved
9	0x00000200	TerraStar-C service
10	0x00000400	TerraStar-L service
11	0x00000800	RTK ASSIST service
12	0x00001000	RTK ASSIST PRO service
13	0x00002000	TerraStar-C PRO service
14	0x00004000	TerraStar-X service
15-31	0xFFFF8000	Reserved

**Table 198: TerraStar Region Restriction**

<b>ASCII</b>	<b>Binary</b>	<b>Description</b>
NONE	0	TerraStar operation has no region restrictions.
GEOGATED	1	TerraStar operation limited to on-land GEOGATED is also the default value reported if there is no subscription
LOCAL_AREA	2	TerraStar operation limited to radius from local area center point
NEARSHORE	3	TerraStar operation limited to on land and near shore (coastal) regions

## 3.197 TERRASTARSTATUS

### *TerraStar decoder and subscription status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains status information for the TerraStar decoder and subscription.

**Message ID:** 1729

**Log Type:** Asynch

**Recommended Input:**

```
log terrastarstatusa onchanged
```

**ASCII Example:**

```
#TERRASTARSTATUSA,COM1,0,49.5,FINESTEERING,1769,332336.443,02000000,fdc1,12602;  
ENABLE,LOCKED,0,DISABLED,ONSHORE*555155a5
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	TERRASTAR STATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Access	Access status. ENABLE (1) if the subscription is valid; DISABLE (0) otherwise	Enum	4	H
3	Sync state	Decoder data synchronization state (see <i>Table 199: Decoder Data Synchronization State</i> below)	Enum	4	H+4
4	Reserved		Ulong	4	H+8
5	Local area status	For local-area subscriptions, indicates if the receiver is within the permitted area (see <i>Table 200: TerraStar Local Area Status</i> on the next page)	Enum	4	H+12
6	Geogating status	Geogating status (see <i>Table 201: TerraStar Geogating Status</i> on the next page)	Enum	4	H+16
7	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+20
8	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 199: Decoder Data Synchronization State**

ASCII	Binary	Description
NO_SIGNAL	0	None of the decoders have received data in the last 30 seconds
SEARCH	1	At least one decoder is receiving data and is searching for the format
LOCKED	2	At lease one decoder has locked onto the format

**Table 200: TerraStar Local Area Status**

ASCII	Binary	Description
DISABLED	0	The subscription is not restricted to a local area. This is also the value when there is no subscription.
WAITING_FOR_POSITION	1	Waiting for a position
RANGE_CHECK	16	Checking position against local area region restriction
IN_RANGE	129	Receiver is within the permitted local area
OUT_OF_RANGE	130	Receiver is outside the permitted local area
POSITION_TOO_OLD	255	Position is too old

**Table 201: TerraStar Geogating Status**

ASCII	Binary	Description
DISABLED	0	The subscription is restricted to a local area or there is no region restriction. This is also the value when there is no subscription.
WAITING_FOR_POSITION	1	Waiting for a position
ONSHORE	129	Receiver is over land
OFFSHORE	130	Receiver is over water
POSITION_TOO_OLD	255	Position is too old
PROCESSING	1000	Geogater is determining status

## 3.198 TIME

### *Time data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log provides several time related pieces of information including receiver clock offset and UTC time and offset. It can also be used to determine any offset in the PPS signal relative to GPS reference time.

To find any offset in the PPS signal, log the TIME log 'ontime' at the same rate as the PPS output. For example, if the PPS output is configured to output at a rate of 0.5 seconds (see the **PPSCONTROL** command on page 265) log the TIME log 'ontime 0.5' as follows:

```
log time ontime 0.5
```

The TIME log offset field can then be used to determine any offset in PPS output relative to GPS reference time.

GPS reference time is the receiver's estimate of the true GPS system time. GPS reference time can be found in the header of the TIME log. The relationship between GPS reference time and true GPS system time is:

GPS system time = GPS reference time - offset

**Message ID:** 101

**Log Type:** Synch

**Recommended Input:**

```
log timea ontime 1
```

**ASCII Example:**

```
#TIMEA,COM1,0,86.5,FINESTEERING,1930,428348.000,02000020,9924,32768;VALID,
1.667187222e-10,9.641617960e-10,-18.00000000000,2017,1,5,22,58,50000,VALID
*2a066e78
```

1. Consider the case where you used the **ADJUST1PPS** command (see page 56) to synchronize two receivers in a primary/secondary relationship to a common external clock. You can use the TIME log after the clock model status is valid to monitor the time difference between the Primary and Secondary receivers.
2. The header of the TIME log gives you the GPS reference time (the week number since January 5th, 1980) and the seconds into that week. The TIME log outputs the UTC offset (offset of GPS system time from UTC time) and the receiver clock offset from GPS system time.

If you want the UTC time in weeks and seconds, take the week number from the header. Then take the seconds into that week, also from the header, and add the correction to the seconds using the 2 offsets. Ensure not to go negative or rollover (go over the total number of seconds, 604800, in a week). In the case of a rollover, add a week and the left over seconds become the seconds into this new week. If negative, subtract a week and the remainder from the seconds of that week become the seconds into this new week.

For example:

```
TIME COM1 0 73.5 FINESTEERING 1432 235661.000 02000000 9924 2616 VALID
-0.000000351 0.000000214 -14.00000000106 2007 6 19 17 27 27000 VALID
```

From the time information above:

GPS reference time = 1432 (GPS reference week), 235661.000 (GPS seconds) from the header.

From the description in *UTC offset* row in the following table:

UTC time = GPS reference time - offset + UTC offset  
UTC time

= week 1432, 235661.000 s - (-0.000000351 (offset)) - 14.00000000106 (UTC offset)  
= week 1432, seconds 235647.00000034994

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	TIME header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	clock status	Clock model status (not including current measurement data), see <i>Table 95: Clock Model Status</i> on page 457	Enum	4	H
3	offset	Receiver clock offset in seconds from GPS system time. A positive offset implies that the receiver clock is ahead of GPS system time. To derive GPS system time, use the following formula:  GPS system time = GPS reference time - offset.  The GPS reference time can be obtained from the log header.	Double	8	H+4
4	offset std	Receiver clock offset standard deviation (s)	Double	8	H+12
5	utc offset	The offset of GPS system time from UTC time, computed using almanac parameters. UTC time is GPS reference time plus the current UTC offset minus the receiver clock offset:  UTC time = GPS reference time - offset + UTC offset	Double	8	H+20

Field	Field type	Description	Format	Binary Bytes	Binary Offset
6	utc year	UTC year	Ulong	4	H+28
7	utc month	UTC month (0-12) If UTC time is unknown, the value for month is 0.	Uchar	1	H+32
8	utc day	UTC day (0-31) If UTC time is unknown, the value for day is 0.	Uchar	1	H+33
9	utc hour	UTC hour (0-23)	Uchar	1	H+34
10	utc min	UTC minute (0-59)	Uchar	1	H+35
11	utc ms	UTC millisecond (0-60999) Maximum of 60999 when leap second is applied.	Ulong	4	H+36
12	utc status	UTC status 0 = Invalid 1 = Valid 2 = Warning <sup>1</sup>	Enum	4	H+40
13	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+44
14	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

<sup>1</sup>Indicates that the leap second value is used as a default due to the lack of an almanac.

## 3.199 TIMESYNC

### *Synchronize time between GNSS receivers*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The TIMESYNC log is used in conjunction with the **ADJUST1PPS** command (see page 56) to synchronize the time between GNSS receivers.

**Message ID:** 492

**Log Type:** Synch

**Recommended Input:**

```
log timesynca ontime 1
```

**ASCII Example:**

```
#TIMESYNCA,COM1,0,46.0,FINESTEERING,1337,410095.000,02000000,bd3f,1984;1337,410095000,FINESTEERING*aa2025db
```

The time data embedded in this log represents the time of the most recent 1PPS signal. Refer to *Figure 2: 1PPS Alignment* on page 56 to see the alignment between a Fine and a Cold Clock receiver. Also refer to Transferring Time Between Receivers in the [OEM7 Installation and Operation User Manual](#).

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	TIMESYNC header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	week	GPS reference week number	Ulong	4	H
3	ms	Number of milliseconds into the GPS reference week	Ulong	4	H+4
4	time status	GPS reference time Status, see <i>Table 11: GPS Reference Time Status</i> on page 48	Enum	4	H+8
5	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+12
6	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.200 TRACKSTAT

### *Tracking status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

The TRACKSTAT log contains an entry for each channel. If there are multiple signal channels for one satellite (for example L1, L2 P(Y), L2C, and L5 for GPS), then there will be multiple entries for that satellite.

As shown in *Table 149: Channel Tracking Status* on page 704 these entries can be differentiated by bit 20, which is set if there are multiple observables for a given satellite, and bits 21-25, which denote the signal type for the observation.

A zero in the PRN/slot of the TRACKSTAT log indicates the channel should be considered idle with the exception of those for GLONASS. A GLONASS channel should only be considered idle if the tracking state is 0 in the channel tracking status word.

For dual antenna receivers, a TRACKSTAT\_1 log can be requested to get TRACKSTAT data from the second antenna. As described in *Table 3: Binary Message Header Structure* on page 34, the message type indicates the log is from the second antenna. To request an ASCII log enter TRACKSTATA\_1 and for a binary log enter TRACKSTATB\_1.

**Message ID: 83**

**Log Type: Synch**

**Recommended Input:**

```
log trackstata ontime 1
```

**ASCII Example:**

```
#TRACKSTATA,COM1,0,49.5,FINESTEERING,1337,410139.000,02000000,457c,1984;
SOL_COMPUTED,PSRDIFF,5.0,30,

0,0,0c0221e0,0.000,0.000,0.047,0.000,0.000,NA,0.000*255a732e
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	TRACKSTAT header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	sol status	Solution status (see <i>Table 80: Solution Status</i> on page 432)	Enum	4	H

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
3	pos type	Position type (see <i>Table 81: Position or Velocity Type</i> on page 433)	Enum	4	H+4
4	cutoff	GPS tracking elevation cut-off angle	Float	4	H+8
5	# chans	Number of hardware channels with information to follow	Ulong	4	H+12
6	PRN/slot	Satellite PRN number of range measurement Refer to <i>PRN Numbers</i> on page 48	Short	2	H+16
7	glofreq	(GLONASS Frequency + 7), see <i>GLONASS Slot and Frequency Numbers</i> on page 47	Short	2	H+18
8	ch-tr-status	Channel tracking status (see <i>Table 149: Channel Tracking Status</i> on page 704)	Ulong	4	H+20
9	psr	Pseudorange (m) - if this field is zero but the channel tracking status in the previous field indicates that the card is phase locked and code locked, the pseudorange has not been calculated yet	Double	8	H+24
10	Doppler	Doppler frequency (Hz)	Float	4	H+32
11	C/No	Carrier to noise density ratio (dB-Hz)	Float	4	H+36
12	locktime	Number of seconds of continuous tracking (no cycle slips)	Float	4	H+40
13	psr res	Pseudorange residual from pseudorange position filter (m)	Float	4	H+44
14	reject	Range reject code from pseudorange position filter (see <i>Table 86: Observation Statuses</i> on page 438)	Enum	4	H+48
15	psr weight	Pseudorange filter weighting	Float	4	H+52
16...	Next PRN offset = H+16+ (#chans x 40)				
17	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+16 (#chans x 40)
18	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.201 TRANSFERPORTSTATUS

*Display the state of the USB transfer port*

Platform: PwrPak7

PwrPak7M variants do not support this log.

This log displays the current state of the USB transfer port.

**Message ID: 2114**

**Log Type: Asynch**

**Recommended Input:**

```
log transferportstatusa onchanged
```

**ASCII Example:**

```
#TRANSFERPORTSTATUSA,COM1,0,86.5,UNKNOWN,0,10.551,02100000,4b3f,32768;USBSTICK,HOST*9f7ad7be
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	TRANSFERPORTSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	USB Detection Type	Type of connection detected See <i>Table 202: USB Detection Type</i> below	Enum	4	H
3	USB Mode	Current USB operation mode See <i>Table 203: USB Mode</i> on the next page	Enum	4	H+4
4	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+8
5	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 202: USB Detection Type**

Binary	ASCII	Description
0	NONE	Nothing is detected
1	USBSTICK	A flash drive is detected
2	PC	A computer is detected
3	ERROR	This is an error state

**Table 203: USB Mode**

<b>Binary</b>	<b>ASCII</b>	<b>Description</b>
0	DEVICE	The USB port is in device mode
1	HOST	The USB port is in host mode
2	OTG	The USB port is in OTG mode
3	INVALID	The USB port is in an invalid mode
4	NONE	The USB port is not in an operation mode
5	TRANSITION	The USB port operation mode is transitioning

## 3.202 UPTIME

### *Report the running time of the receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the number of seconds the receiver's firmware has been running, after the application of power or after the completion of a reset.

**Message ID:** 1777

**Log Type:** Polled

**Recommended Input:**

```
log uptimea once
```

**ASCII Example:**

```
#UPTIMEA,COM1,0,80.0,FINESTEERING,1928,495123.000,02000020,27d2,32768;151639*013e11a7
```

In this example, 151639 seconds since power-on = 42.1 hours.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	UPTIME header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Uptime	The number of seconds the receiver has been running after a power up or reset.	Ulong	4	H
3	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+4
4	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.203 USERANTENNA

### *Display user defined antennas*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log lists the stored used defined antennas and their parameters.

**Message ID:** 2282

**Recommended input:**

```
log userantennaa onchanged
```

**ASCII Example:**

```
#USERANTENNA,COM1,1,80.5,UNKNOWN,0,1.101,02000020,7fac,32768;USER_ANTENNA_1,
"NOVCUSTOM",2,GPSL1,0.09,0.00,51.74,0.00,-0.02,-0.10,-0.20,0.23,-0.17,-0.03,
0.14,0.25,0.25,0.07,-0.23,-0.54,-0.67,-0.49,-0.01,0.55,0.83,0.46,GPSL2,-1.53,
1.65,52.00,0.00,0.00,0.00,-0.02,-0.12,-0.28,-0.47,-0.61,-0.56,-0.28,0.23,0.83,
1.28,1.30,0.76,-0.15,-0.94,-0.81,0.97*8b6fb25e
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	USERANTENNA header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Antenna type	User defined antenna type See <i>Table 204: User-Defined Antenna Type</i> on the next page	Enum	4	H
3	Antenna name	Name of the user defined antenna	Char [16]	16	H+4
4	Number of frequencies	Number of frequencies for which corrections are stored	Ulong	8	H+20
5	Frequency	The frequency for which the phase center corrections are valid See <i>Table 19: Frequency Type</i> on page 82	Enum	4	H+28
6	NorthOffset	North phase center offset in millimeters	Float	4	H+32
7	EastOffset	East phase center offset in millimeters	Float	4	H+36
8	UpOffset	Up phase center offset in millimeters	Float	4	H+40
9	PCVArray	19 element array of Phase Center Variations, in millimeters, in 5-degree elevation increments from 90 to 0	Float [19]	76	H+44
10	Next Frequency = H + 28 + (Number of frequencies x 92)				
11	xxxx	32-bit CRC (ASCII and binary only)	Hex	4	Variable
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 204: User-Defined Antenna Type**

<b>Binary</b>	<b>ASCII</b>
1001	USER_ANTENNA_1
1002	USER_ANTENNA_2
1003	USER_ANTENNA_3
1004	USER_ANTENNA_4
1005	USER_ANTENNA_5

## 3.204 USERI2CRESPONSE

### *Status of USERI2CREAD or USERI2CWRITE Command*

**Platform:** OEM7600, OEM7700, OEM7720

This log reports the status of a previously executed **USERI2CREAD** or **USERI2CWRITE** command. There is one log emitted for each command that is executed.

For the **USERI2CREAD** command (see page 384), this log outputs the data read from the device on the I2C bus and the status of the read operation.

For the **USERI2CWRITE** command (see page 386), the status of the write operation is reported and the data field will always be 0.

**Message ID:** 2234

#### Recommended Input:

```
log USERI2CRESPONSE onnew
```

#### Abbreviated ASCII Example 1:

```
USERI2CREAD 70 4 aabbccdd 12 6789
```

```
<USERI2CRESPONSE COM1 0 84.0 FINESTEERING 1994 257885.895 02000000 e3f6 32768
<      70 aabbccdd OK READ 6789 12 000102030405060708090a0b
```

#### Abbreviated ASCII Example 2:

```
USERI2CWRITE 70 3 aabbcc 8 0001020304050607 12345
```

```
<USERI2CRESPONSE COM1 0 84.0 FINESTEERING 1994 257885.895 02000000 e3f6 32768
<      70 aabbcc OK WRITE 12345 0
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	USERI2CRESPONSE header	Log header. See Messages for more information.	-	H	0
2	DeviceAddress	The 7 bit address of the I2C device. Valid values are 0 through 127.  For ASCII and Abbreviated commands, this field is a hexadecimal string of two digits. There is no 0x prefix and spaces are not allowed in the string.	Uchar	1 <sup>1</sup>	H
3	RegisterAddress	The actual register address used for the operation. This is a ULONG value in hexadecimal format (without 0x prefix).	Ulong	4	H+4

<sup>1</sup>In the binary case, additional bytes of padding are added after this field to maintain 4-byte alignment for the fields that follow.

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
4	ErrorCode	Error code for the operation. See <i>Table 205: Error Code</i> below.	Enum	4	H+8
5	OperationMode	Operation mode code. See <i>Table 206: Operation Mode Code</i> below.	Enum	4	H+12
6	TransactionID	This is the copy of Transaction ID provided to the command.	Ulong	4	H+16
7	ReadDataLength	For a Read operation, this is the actual number of bytes read from the I2C device. For a Write operation, this value is always zero.	Ulong	4	H+20
8	ReadData	For a Read operation, this is the data read from the device. For ASCII logs this field is displayed as a string of hexadecimal digits, with two digits per byte. The first byte retrieved from the I2C device is the first byte displayed and so on.  The maximum size of this field is 256 bytes.  When ReadDataLength is zero, this field will be empty.	HEXBYTE ARRAY	Y	H+24

Table 205: Error Code

Binary	ASCII	Description
0	OK	I2C transaction is successful
1	IN_PROGRESS	I2C transaction is currently in progress
2	DATA_TRUNCATION	I2C transaction read data was truncated
3	BUS_BUSY	I2C bus is busy
4	NO_DEVICE_REPLY	No device replied to the I2C transaction request
5	BUS_ERROR	I2C bus error or bus arbitration lost
6	TIMEOUT	I2C transaction has timed out
7	UNKNOWN_FAILURE	I2C transaction has an unexplained failure

Table 206: Operation Mode Code

Binary	ASCII	Description
0	NONE	No Operation
1	READ	Read Operation

Binary	ASCII	Description
2	WRITE	Write Operation
3	SHUTDOWN	Shut down Operation

## 3.205 VALIDMODELS

### Valid model information

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log gives a list of valid authorized models available and expiry date information.

If a model has no expiry date, it reports the year, month and day fields as 0s.

**Message ID:** 206

**Log Type:** Asynch

**Recommended Input:**

```
log validmodelsa once
```

**ASCII Example:**

```
#VALIDMODELSA,COM1,0,92.0,FINESTEERING,1610,499139.682,02000000,342f,6293;1,"D2LR0RCCR",0,0,0*d0580c1b
```

Use the VALIDMODELS log to output a list of available models for the receiver. Use the **AUTH** command (see page 77), to add a model and the **MODEL** command (see page 230) to change the currently active model. See the **VERSION** log on page 873 for the currently active model

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	VALIDMODELS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	#mod	Number of models with information to follow	Ulong	4	H
3	model	Model name	String [Max16]	Variable <sup>1</sup>	H+4
4	expyear	Expiry year	Ulong	4	Variable Max: H+20
5	expmonth	Expiry month	Ulong	4	Variable Max: H+24
6	expday	Expiry day	Ulong	4	Variable: Max: H+28
7...	Next model offset = H+4+(#mod x variable [max:28])				

<sup>1</sup>In the binary case, each string field needs to be NULL terminated and additional bytes of padding added to maintain 4-byte alignment, up to the maximum defined by the string size. The next defined field starts immediately at the next 4-byte alignment following the NULL.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
8	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#mod x variable [max:28])
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 3.206 VERIPOSINFO

### *Veripos subscription information*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log contains details on the Veripos subscription.

**Message ID:** 1728

**Log Type:** Asynch

**Recommended Input:**

```
log veriposinfoa onchanged
```

**ASCII Example:**

```
#VERIPOSINFOA,COM2,0,60.5,FINESTEERING,1779,176287.725,02044008,31fa,12740;
320325,NCC_CONTROLLED,00000101,"Q"*26a9f04e
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	VERIPOSINFO header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Serial number	Receiver serial number	Ulong	4	H
3	Mode	Operating mode (see <i>Table 207: Veripos Operating Mode</i> below)	Enum	4	H+4
4	Details	Subscription details (refer to <i>Table 208: Veripos Subscription Details Mask</i> on the next page)	Hex	4	H+8
5	Service code	Veripos service code	Char[4]	4	H+12
6	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+16
7	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 207: Veripos Operating Mode**

ASCII	Binary	Description
UNASSIGNED	0	Decoder has not had an assigned operating mode
NCC_CONTROLLED	7	Decoder operation disabled by a command from the Network Control Center (NCC)
NO_DISABLE	8	Decoder operation not disabled
BUBBLE	100	Decoder is operating in a Veripos permitted subscription-free bubble
MODEL_DENIED	101	Decoder operation is not permitted on the current firmware model

**Table 208: Veripos Subscription Details Mask**

<b>Bit</b>	<b>Mask</b>	<b>Description</b>
0	0x001	Subscription permits differential positioning
8	0x100	Subscription permits Apex PPP positioning

## 3.207 VERIPOSSTATUS

### *Veripos decoder and subscription status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log contains status information for the Veripos decoder and subscription.

**Message ID:** 1730

**Log Type:** Asynch

**Recommended Input:**

```
log veriposstatusa onchanged
```

**ASCII Example:**

```
#VERIPOSSTATUSA,COM2,0,62.0,FINESTEERING,1779,176955.656,02004008,0719,12740;  
ENABLE,LOCKED*7c5f85ae
```

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	VERIPOSSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	Access	Access status. ENABLE (1) if the subscription is valid; DISABLE (0) otherwise	Enum	4	H
3	Sync state	Decoder data synchronization state (see <i>Table 209: Decoder Data Synchronization State</i> below)	Enum	4	H+4
4	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+8
5	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 209: Decoder Data Synchronization State**

ASCII	Binary	Description
NO_SIGNAL	0	None of the decoders have received data in the last 30 seconds
SEARCH	1	At least one decoder is receiving data and is searching for the format
LOCKED	2	At lease one decoder has locked onto the format

## 3.208 VERSION

### Version information

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log contains the version information for all components of a system. A component may be hardware (for example, a receiver or data collector) or firmware in the form of applications or data (for example, data blocks for height models or user applications). See *Table 211: Firmware and Boot Version Field Formats* on page 876 for details on the format of key fields.

See also the **VALIDMODELS** log on page 868.

**Message ID:** 37

**Log Type:** Polled

**Recommended Input:**

```
log versiona once
```

**Abbreviated ASCII Example:**

```

```

The VERSION log is a useful log as a first communication with your receiver. Once connected, using NovAtel Connect or a terminal emulator program, log VERSION and check that the output makes sense. Also, ensure that you have the receiver components you expected.

Field	Field type	Description	Format	Binary Bytes	Binary Offset
1	VERSION header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	# comp	Number of components (cards, and so on)	Long	4	H
3	type	Component type (see <i>Table 210: Component Types</i> on page 875)	Enum	4	H+4

Field	Field type	Description	Format	Binary Bytes	Binary Offset
4	model	OEM7 firmware model number e.g., CFNPNNTVN indicates the receiver's current model functionality  When the component type is ENCLOSURE, the model specifies the enclosure type.	Char [16]	16	H+8
5	psn	Product serial number	Char [16]	16	H+24
6	hw version	Hardware version in the format: P-R Where P = hardware platform R = hardware revision Example: OEM7700-1.00	Char [16]	16	H+40
7	sw version	Firmware version, see <i>Table 211: Firmware and Boot Version Field Formats</i> on page 876	Char [16]	16	H+56
8	boot version	Boot code version, see <i>Table 211: Firmware and Boot Version Field Formats</i> on page 876	Char [16]	16	H+72
9	comp date	Firmware compile date in the format: YYYY/Mmm/DD Where YYYY = year Mmm = month DD = day (1-31) Example: 2018/Jul/10	Char [12]	12	H+88
10	comp time	Firmware compile time in the format: HH:MM:SS Where: HH = hours MM = minutes SS = seconds Example: 14:37:01	Char [12]	12	H+100
11...	Next component offset = H + 4 + (#comp x 108)				
12	xxxx	32-bit CRC (ASCII and Binary only)	Ulong	4	H+4+ (#comp x 108)
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 210: Component Types

Binary	ASCII	Description
0	UNKNOWN	Unknown component
1	GPSCARD	OEM7 family receiver In an enclosure product this is the receiver card in the enclosure.
2	CONTROLLER	Reserved
3	ENCLOSURE	OEM card enclosure
4-6	Reserved	
7	IMUCARD	IMU integrated in the enclosure
8	USERINFO	Application specific information
12-14	Reserved	
15	WIFI	Wi-Fi radio firmware
16-17	Reserved	
18	RADIO	UHF radio component
19	WWW_CONTENT	Web Server content
20	Regulatory	Regulatory configuration
21	OEM7FPGA	OEM7 FPGA version
22	APPLICATION	Embedded application
23	Package	Package
24	Reserved	
25	DEFAULT_CONFIG	Default configuration data
26	WHEELSENSOR	Wheel sensor in the enclosure
27	EMBEDDED_AUTH	Embedded Auth Code data
981073920 (0x3A7A0000)	DB_HEIGHTMODEL	Height/track model data
981073928 (0x3A7A0008)	DB_WWWISO	Web UI ISO Image
981073930 (0x3A7A000A)	DB_LUA_SCRIPTS	Lua Script ISO Image

Table 211: Firmware and Boot Version Field Formats

Field Format (ASCII)	Description	Example	
NWXYZFFMMRN0000	N = Family Name The Family Name can be: O = OEM	Software Version: OM7CR0500RN0000  Boot Version: OM7BR0001RB0000	In both examples, the Family Name is <b>O</b> .
	WX = Product The Product can be: M7: OEM7 product A7: Agriculture optimized OEM7 product		In both examples, the Product is <b>M7</b> .
	Y = Image Type The Image Type can be: B: boot code M: main firmware application C: combined main firmware application and user application		In the Software Version example, the Image Type is <b>C</b> . In the Boot Version example, the Image Type is <b>B</b> .
	Z = Signature The Signature can be: R: Officially signed H: High Speed signed		In both examples the Signature is <b>R</b> .
	FF = Feature Release Number		In the Software Version example, the Feature Release Number is <b>05</b> . In the Boot Version example, the Feature Release Number is <b>00</b> .
	MM = Maintenance Release Number		In both examples, the Maintenance Release Number is <b>00</b> .

Field Format (ASCII)	Description	Example	
	R = Release Type The Release Type can be: A: Alpha B: Beta R: Release S: Special E: Engineering Special C: Customer Approved Special		In both examples, the Release Type is <b>R</b> .
	N = Distribution Permit The Distribution Permit can be: N: No restrictions B: Boot Code H: High Speed Build (Requires a permit to use)		In the Software Version example, the Distribution Permit is <b>N</b> .  In the Boot Version example, the Distribution Permit is <b>B</b> .
	0000 = Minor Release Indicator		In both examples, the Minor Release Indicator is <b>0000</b> .

The firmware version of a receiver is also presented in a short version (e.g. 7.05.04). The short version is the product number, feature release number and maintenance release number separated by dots. For example, the firmware version OM7MR0504RN0000 has a short version of 7.05.04.

## 3.209 WIFIAPSETTINGS

### *Display the Wi-Fi access point configuration*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this log to display the Wi-Fi access point configuration. If the access point is not currently operational, the log reports the access point configuration to be applied the next time the **WIFIMODE AP** or **WIFIMODE CONCURRENT** command is received.

The term passkey and password are the same.

**Message ID: 2093**

**Log Type: Polled**

**Recommended Input:**

```
LOG WIFIAPSETTINGS
```

**ASCII Example:**

```
#WIFIAPSETTINGS SA, COM1, 0, 77.5, FINESTEERING, 2007, 167962.000, 02000000, fc0e, 14693;
"PwrPak7-NMNE16470005M", "12345678", 2P4GHZ, WPA2, CCMP, US, 11, "2d:43:5a:63:79:6f"
*546c6f08
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	WIFIAPSETTINGS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	SSID	SSID of the AP	String [Max 33]	Variable	H
3	passkey	Passkey of the AP	String [Max 65]	Variable	Variable
4	band	Wi-Fi operating band. See <i>Table 212: Wi-Fi Band</i> on the next page.	Enum	4	Variable
5	security protocol	Wireless security protocol. See <i>Table 213: Wi-Fi Security Protocol</i> on the next page.	Enum	4	Variable
6	encryption	Wireless encryption type. See <i>Table 214: Wi-Fi Encryption Type</i> on the next page.	Enum	4	Variable

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7	region	Regulatory region. See <i>Table 215: Regulatory Region</i> on the next page.	Enum	4	Variable
8	channel	Wireless channel used by access point to communicate with connected clients.	Int	4	Variable
9	BSSID	BSSID of the AP (MAC of the Wi-Fi interface)	String [Max 18]	Variable	Variable
10	xxxx	32-bit CRC (ASCII or Binary only)	Hex	4	Variable
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 212: Wi-Fi Band

Binary	ASCII	Description
1	2P4GHZ	2.4 GHz

Table 213: Wi-Fi Security Protocol

Binary	ASCII	Description
1	OPEN	Open network (No security)
2	WPA	Wi-Fi Protected Access
3	WPA2	Wi-Fi Protected Access version 2

NovAtel Wi-Fi access points only support the WPA2 security protocol. As a result, the **WIFIAPSETTINGS** log will only report **WPA2**.

NovAtel Wi-Fi Clients support OPEN, WPA, and WPA2 security protocols.

Table 214: Wi-Fi Encryption Type

Binary	ASCII	Description
1	OPEN	Open (no encryption)
2	TKIP	Temporal Key Integrity Protocol (used with WPA)
3	CCMP	AES-based CCMP (Cipher Chaining Message Authentication) used with WPA2

NovAtel Wi-Fi access points only support the WPA2 security protocol. As a result, the **WIFIAPSETTINGS** log will only report **CCMP**.

**Table 215: Regulatory Region**

<b>Binary</b>	<b>ASCII</b>	<b>Description</b>
0	None	Receiver has not been configured to comply with any regional regulatory requirements. Wireless components (e.g. Wi-Fi) will not operate. Contact NovAtel Customer Support.
1	US	United States
2	EU	Europe
3	AU	Australia
4	JP	Japan
5	NZ	New Zealand
6	BR	Brazil

## 3.210 WIFINETLIST

*Display a list of Wi-Fi networks in range of client*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this log to display information about Wi-Fi access points detected by the receiver when configured in either Client or Concurrent mode.

**Message ID: 2210**

**Log Type: Asynch**

**Recommended input:**

```
log wifinetlist onchanged
```

**ASCII Example:**

```
#WIFINETLISTA, COM1, 0, 73.0, FINESTEERING, 1989, 422765.530, 02000000, 9906, 32768;1, "SM7-i NMRT00000001M", -20, 7, "aa:bb:cc:dd:ee:01", WPA2*0727340b
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	WIFINETLIST header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	num_networks	Number of network records to follow	Ulong	4	H
3	SSID	SSID of scanned access point.	String [Max 33]	variable	H+4
4	RSSI	Absolute value of RSSI (dBm)	Int	4	variable
5	channel	RF channel to use	Ulong	4	variable
6	BSSID	MAC address of the access point.	String [Max 18]	variable	variable
7	security	Security mode of access point. <i>Table 216: Wi-Fi Security Type</i> below	Enum	4	variable

**Table 216: Wi-Fi Security Type**

Binary	ASCII	Description
1	OPEN	Open network (no security)
2	WPA	Wi-Fi protected access
3	WPA2	Wi-Fi protected access II

## 3.211 WIFISTATUS

### *Display status information of receiver Wi-Fi*

Platform: PwrPak7, SMART7-I, SMART7-SI, SMART7-W

PwrPak7M and PwrPak7Q variants do not support this command.

Use this log to display the current status of a Wi-Fi Client and or Access Point in addition to information about any connected Access Point and or Clients.

**Message ID: 2207**

**Log Type: Asynch**

**Recommended input:**

```
log wifistatus onchanged
```

**ASCII Example:**

```
#WIFISTATUSA,COM1,0,63.5,UNKNOWN,0,31.682,02440000,c017,32768;CONCURRENT_
OPERATIONAL," PwrPak7-NMND17130002Z",-20,11,"
00:21:66:01:47:BB",WPA2,1,"D4:6E:0E:05:B1:F6"*faee8ed9
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	WIFISTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	status	Wi-Fi operational status. Refer to <i>Table 217: Wi-Fi Status</i> on the next page.	String [Max 33]	Variable	H
3	AP SSID	SSID of connected access point. This field is blank if the client is not connected to an access point.	String [Max 33]	Variable	
4	AP RSSI	Value of RSSI (dBm) of connection to access point. This field is zero if the client is not connected to an access point.	Ulong	4	
5	AP channel	Channel use to connect to access point. This field is zero if the client is not connected to an access point.	Ulong	4	
6	AP BSSID	MAC address of connected access point. This field is blank if the client is not connected to an access point.	Ulong	4	
7	AP security	Security mode of connected access point. See <i>Table 216: Wi-Fi Security Type</i> on the previous page in the <b>WIFINETLIST</b> command (see page 881). The value of this field is only valid if the AP SSID field is not blank.	Enum	4	

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	#clients	Number of clients connected to an access point to follow.	Ulong	4	
9	BSSID	MAC address of connected client.	String [Max 18]	Variable	
10...	Next Client				

Table 217: Wi-Fi Status

Binary	ASCII	Description
0	STARTUP	
1	OFF	Wi-Fi hardware is powered off
2	ON	Wi-Fi hardware is powered on but not configured
3	CONFIGURING_ ACCESSPOINT	Wi-Fi hardware is being configured as an access point
4	ACCESSPOINT_ OPERATIONAL	Wi-Fi hardware is operating as an access point and is ready to accept client connections
5	CONFIGURING_ CLIENT	Wi-Fi hardware is being configured as a client station
6	CLIENT_ OPERATIONAL	Wi-Fi hardware is operating as a client but is not connected to an access point
7	BOOTING_UP	Wi-Fi hardware is booting up
8	BOOTUP_ COMPLETE	Wi-Fi hardware has booted up
9	UPGRADE_ REQUIRED	Wi-Fi firmware version does not match required version
10	UPGRADING_ FIRMWARE	Wi-Fi firmware is being upgraded
11	UPGRADING_ FIRMWARE_10	Wi-Fi firmware update is 10% complete
12	UPGRADING_ FIRMWARE_20	Wi-Fi firmware update is 20% complete
13	UPGRADING_ FIRMWARE_30	Wi-Fi firmware update is 30% complete
14	UPGRADING_ FIRMWARE_40	Wi-Fi firmware update is 40% complete
15	UPGRADING_ FIRMWARE_50	Wi-Fi firmware update is 50% complete

Binary	ASCII	Description
16	UPGRADING_ FIRMWARE_60	Wi-Fi firmware update is 60% complete
17	UPGRADING_ FIRMWARE_70	Wi-Fi firmware update is 70% complete
18	UPGRADING_ FIRMWARE_80	Wi-Fi firmware update is 80% complete
19	UPGRADING_ FIRMWARE_90	Wi-Fi firmware update is 90% complete
20	UPGRADING_ FIRMWARE_COMPLETE	Wi-Fi firmware update is 100% complete
21	ERROR	An error has occurred
22	CONFIGURING_ CONCURRENT	Wi-Fi hardware is being configured to operate as both an access point and client concurrently
23	CONCURRENT_ OPERATIONAL	Wi-Fi hardware is operating as both an access point and client. The client is not connected to an access point.
24	CONNECTING_TO_AP	Wi-Fi hardware is attempting to connect to an access point
25	CONNECTED_TO_AP	Wi-Fi hardware has successfully connected to an access point
26	CONNECTION_FAILURE	Wi-Fi client failed to connect to an access point. Possible causes include invalid password provided in the <b>WIFINETCONFIG</b> command (see page 397)
27	CONFIGURING_ NETWORK_ PARAMETERS	Wi-Fi client is configuring its network parameters based on active connection to an access point
28	CONNECTION_REFUSED	Wi-Fi client failed on initial attempt to connect to an access point due to the connection being actively refused by the access point Possible causes include invalid configuration settings in the <b>WIFINETCONFIG</b> command on page 397
29	PREFERRED_ NETWORK_ MISCONFIGURED	Wi-Fi client cannot connect to preferred access point due to a misconfiguration of network parameters in the <b>WIFINETCONFIG</b> command on page 397
30	CONCURRENT_ CONNECTING_TO_AP	Wi-Fi concurrent client is configuring its network parameters based on active connection to an access point
31	CONCURRENT_ CONFIGURING_ NETWORK_PARAMS	Wi-Fi concurrent client is configuring its network parameters based on active connection to an access point

Binary	ASCII	Description
32	CONCURRENT_ CONNECTED_TO_AP	Wi-Fi concurrent client has successfully connected to an access point
33	DISCONNECTING_ FROM_AP	Wi-Fi client is disconnecting from an access point
34	CONCURRENT_ DISCONNECTING_ FROM_AP	Wi-Fi concurrent is disconnecting from an access point
35	BOOTUP_CONNECTING_ TO_WIFI_MODULE	
36	BOOTUP_ERROR	

## Chapter 4 SPAN Commands

The commands used to configure GNSS+INS functions are described in the following sections.

For information about other available commands, refer to *Commands* on page 54.

## 4.1 ALIGNMENTMODE

### *Set the Alignment Mode*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to set the alignment method used to initialize the SPAN system.

The default ALIGNMENTMODE is AUTOMATIC. In this mode, the first available method to align is used.

Sending the ALIGNMENTMODE command manually overrides the AUTOMATIC setting and changes the options available to complete an alignment.

**Message ID:** 1214

#### Abbreviated ASCII Syntax:

```
ALIGNMENTMODE mode
```

#### Abbreviated ASCII Example:

```
ALIGNMENTMODE AIDED_TRANSFER
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	ALIGNMENTMODE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	mode	UNAIDED	0	Static coarse alignment or kinematic alignment methods are available.	Enum	4	H
		AIDED_TRANSFER	2	Seed the initial azimuth estimate from the ALIGN solution.			
		AUTOMATIC	3	Seed the full attitude from the ALIGN solution, perform a regular static coarse alignment or perform a kinematic alignment, whichever is possible first.			
		STATIC	4	Static coarse alignment method only.			
		KINEMATIC	5	Kinematic alignment method only.			

If the **ALIGNMENTMODE** selected can use a kinematic alignment (UNAIDED, KINEMATIC or AUTOMATIC), the **SETINSROTATION RBV** command must be sent to the receiver regardless of system configuration and IMU orientation.

It is *strongly recommended* to use the **SETINSROTATION RBV** command to define the orientation of the system for all configurations.

NVM Seed injected (see the **INSSEED** command on page 903) and commanded (see **SETINITAZIMUTH** command on page 917) alignments are valid for all alignment modes and will supersede all other options if valid and available.

## 4.2 CONNECTIMU

### *Connects an IMU to a Port*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7

Use this command to specify the type of IMU connected to the receiver and the receiver port used by the IMU.

**Message ID:** 1428

**Abbreviated ASCII Syntax:**

```
CONNECTIMU IMUPort IMUType
```

**Abbreviated ASCII Example:**

```
CONNECTIMU COM2 LN200
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	CONNECTIMU header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	IMUPort	COM1	1	IMU Port is COM port 1	Enum	4	H
		COM2	2	IMU Port is COM port 2			
		COM3	3	IMU Port is COM port 3			
		SPI	7	IMU Port is the SPI port			
		COM4	19	IMU Port is COM port 4			
		COM5	31	IMU Port is COM port 5			
3	IMUType	See <i>Table 218: IMU Type</i> on the next page		IMU Type	Enum	4	H+4

SPI is available only on the OEM7500, OEM7600, OEM7700, and OEM7720.

COM4 and COM5 are available only on the OEM7600, OEM7700 and OEM7720.

The IMU-ISA-100C, IMU-FSAS, IMU-HG1900, IMU-LN200, IMU- $\mu$ IMU, IMU-CPT and IMU-KVH1750 use RS-422 protocol and must be connected to a receiver port that is configured to use RS-422. Refer to the [OEM7 Installation and Operation User Manual](#) for information about which receiver ports support RS-422 and instructions for enabling RS-422.

Table 218: IMU Type

Binary	ASCII	Description
0	UNKNOWN	Unknown IMU type (default)
1	HG1700_AG11	Honeywell HG1700 AG11
4	HG1700_AG17	Honeywell HG1700 AG17
5	HG1900_CA29	Honeywell HG1900 CA29
8	LN200	Northrop Grumman LN200/LN200C
11	HG1700_AG58	Honeywell HG1700 AG58
12	HG1700_AG62	Honeywell HG1700 AG62
13	IMAR_FSAS	iMAR iIMU-FSAS
16	KVH_COTS	KVH CPT IMU
20	HG1930_AA99	Honeywell HG1930 AA99
26	ISA100C	Northrop Grumman Litef ISA-100C
27	HG1900_CA50	Honeywell HG1900 CA50
28	HG1930_CA50	Honeywell HG1930 CA50
31	ADIS16488	Analog Devices ADIS16488
32	STIM300	Sensoror STIM300
33	KVH_1750	KVH1750 IMU
41	EPSON_G320	Epson G320N
52	LITEF_MICROIMU	Northrop Grumman Litef $\mu$ IMU-IC
56	STIM300D	Sensoror STIM300, Direct Connection
58	HG4930_AN01	Honeywell HG4930 AN01
61	EPSON_G370	Epson G370N
62	EPSON_G320_200HZ	Epson G320N – 200 Hz

The IMU Type field also supports the legacy ASCII values that contain the "IMU\_" prefix. For example, *LN200* or *IMU\_LN200*.

IMUs recently added as SPAN supported devices, such as the LITEF\_MICROIMU and STIM300D, do not support the "IMU\_" prefix.

Values not shown in this table are reserved.

## 4.3 DMICONFIG

### Configure a DMI Input

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to configure a Distance Measurement Instrument (DMI) input.

For more information about using a DMI, see Distance Measurement Instrument in the [OEM7 SPAN Installation and Operation User Manual](#).

**Message ID:** 2270

#### Abbreviated ASCII Syntax:

```
DMICONFIG dmi_ID switch [source]
```

#### Abbreviated ASCII Examples:

```
DMICONFIG DMI1 ENABLE IMU
```

```
DMICONFIG DMI1 DISABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	DMICONFIG header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	DMI_ID	DMI1	0	ID of the DMI sensor	Enum	4	H
3	Switch	DISABLE	0	Disable the DMI sensor	Enum	4	H+4
		ENABLE	1	Enable the DMI sensor for use			
4	Source	EXT_COUNT	0	Select how the value of the RAWDMI input will be interpreted.	Enum	4	H+8
		EXT_VELOCITY	1	Use <b>IMU</b> for the MIC, UIC, or enclosed IMUs.			
		IMU	2	Use <b>ENCLOSURE</b> for the PwrPak7.			
		ENCLOSURE	3	Default = EXT_COUNT			
5	Reserved	Default = OFF	Default = 1	Reserved Field (Optional) If entering, use default values.	Enum	4	H+12

## 4.4 EXTERNALPVAS

### *Enter PVA Update*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This command should only be used by advanced users of GNSS+INS.

The standard deviations entered using this command must be representative of actual input error.

Relative updates should only be used when they are input at consistent rates.

The **EXTERNALPVAS** command uses a short header if the command is entered in ASCII or Binary.

This command allows the user to provide their own update for INS in full position, velocity, attitude and other updates, and in any combination. The user can also provide height or attitude only updates, along with Zero Velocity Updates (ZUPTs). The position and velocity updates can be entered in local level or ECEF.

The **EXTERNALPVAS** command is designed to provide a method for additional sensor information to be input into the SPAN filter, specifically during GNSS denied environments. This will provide a method to constrain the error growth that is typical in an Inertial Kalman Filter when GNSS observations are unavailable (environments such as: urban canyon, tunnels, jamming etc.). It is important to ensure that the external update and its corresponding standard deviations are accurate and input with minimal latency to provide optimal effectiveness. Entering an external update or its standard deviation inappropriately may have an adverse effect on the SPAN solution.

The default input frame is ECEF. Updates are entered in ECEF unless Local Level is specified using the OptionsMask parameter.

**Message ID: 1463**

#### **Abbreviated ASCII Syntax:**

```
EXTERNALPVAS Position1 Position2 Position3 Velocity1 Velocity2 Velocity3
Attitude1 Attitude2 Attitude3 PosStdDev1 PosStdDev2 PosStdDev3 VelStdDev1
VelStdDev2 VelStdDev3 AttStdDev1 AttStdDev2 AttStdDev3 UpdateMask
OptionsMask
```

#### **Abbreviated ASCII Example: (Local Level Velocity Update)**

```
EXTERNALPVAS 0.0 0.0 0.0 0.4502 10.54 -0.09598 0.0 0.0 0.0 0.0 0.0 0.0 0.01
0.01 0.01 0.0 0.0 0.0 4000 10
```

**Full ASCII Example:** (Local Level Velocity Update)

```
%EXTERNALPVASA,2051,493713.000;0.00000000000,0.00000000000,0.00000000000,

## 4.5 INPUTGIMBALANGLE

### *Input Gimbal Angles into the Receiver*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to input information about the current mount gimbal angles. Gimbal angles are the angle from the locked mount frame to the current gimbal location. They are input in the mount body frame. See [OEM7 SPAN Installation and Operation User Manual](#) for details on frame definitions.

It is very important to follow the order of rotations (Z, X, Y) when determining the rotations from the locked mount frame to the current gimbal location.

**Message ID:** 1317

#### Abbreviated ASCII Syntax:

```
INPUTGIMBALANGLE XAngle YAngle ZAngle [XUncert] [YUncert] [ZUncert]
```

#### Abbreviated ASCII Examples:

```
INPUTGIMBALANGLE 0.003 -0.1234 12.837
```

```
INPUTGIMBALANGLE 0.003 -0.1234 12.837 0.001 0.001 0.005
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INPUTGIMBALANGLE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	X Angle	±180		Right hand rotation from the locked mount frame X axis to the current gimbal location in degrees.	Double	8	H
3	Y Angle	±180		Right hand rotation from the locked mount frame Y axis to the current gimbal location in degrees.	Double	8	H+8
4	Z Angle	±180		Right hand rotation from the locked mount frame Z axis to the current gimbal location to in degrees.	Double	8	H+16
4	X Uncertainty	0 – 180		Uncertainty of X rotation in degrees. Default is 0	Double	8	H+24
5	Y Uncertainty	0 – 180		Uncertainty of Y rotation in degrees. Default is 0	Double	8	H+32
6	Z Uncertainty	0 – 180		Uncertainty of Z rotation in degrees. Default is 0	Double	8	H+40

## 4.6 INSALIGNCONFIG

### Configure ALIGN Parameters for SPAN Receiver

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use the **INSALIGNCONFIG** command to configure ALIGN for a SPAN master receiver to a secondary rover receiver. The command will configure the port on the master and rover and setup corrections at the desired rate. It also attempts to re-establish these corrections should they stop.

#### Important

- This command must be used to define the ALIGN communication between the receivers that SPAN is to configure.
- When using ICOM ports, the Ethernet settings on the SPAN master and rover receiver must be manually configured.
- The master and rover ports must be the same interface type (i.e. Serial to Serial or Ethernet to Ethernet).
- The **INSALIGNCONFIG** command can be used to set the output rate for dual antenna receivers (e.g. OEM7720). In these cases, the port configuration fields are ignored.

**Message ID: 2163**

#### Abbreviated ASCII Syntax:

```
INSALIGNCONFIG masterport [roverport] [baudrate] [outputrate]
```

#### Abbreviated ASCII Example:

```
INSALIGNCONFIG COM1 COM2 230400 5
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	INSALIGNCONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
2	masterport	NOPORT	0	Specify which COM port on the master receiver to use to communicate with an external ALIGN capable receiver.  Selecting NOPORT disables automatic dual antenna configuration.	Enum	4	H
		COM1	1				
		COM2	2				
		COM3	3				
		COM4	19				
		COM5	31				
		ICOM1	23				
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
3	roverport	COM1	1	Specify which rover COM port is connected to the master receiver  (Default = COM2)	Enum	4	H+4
		COM2	2				
		COM3	3				
		COM4	19				
		COM5	31				
		ICOM1	23				
		ICOM2	24				
		ICOM3	25				
		ICOM4	29				
		ICOM5	46				
		ICOM6	47				
		ICOM7	48				
4	baudrate	57600, 115200, 230400, or 460800		Baud rate for communication (Default = 230400)	Ulong	4	H+8

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
5	outputrate	1, 2, 4, 5, 10		The data rate, in Hz, in which ALIGN will be output (Default = 1 Hz)	Ulong	4	H+12
6	Reserved	–		Reserved	Ulong	4	H+16

The SPAN filter only requires ALIGN updates at 1 Hz. Increasing the output rate (using the *outputrate* field) does not increase performance, it only provides ALIGN logs at higher rates.

## 4.7 INSCALIBRATE

### *Initiate calibration of the INS offsets*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to initiate the calibration of INS offsets.

The RBV calibration requires a valid RBV estimate to be entered prior to initializing the calibration. See the **SETINSROTATION** command on page 919 for details on entering a RBV estimate.

For optimal SPAN performance when using Dual Antenna with SPAN, an ALIGN offset calibration is required for each unique installation. This calibration refines the IMU to antenna baseline angular offset from the initial estimate derived from the input lever arms.

**Message ID:** 1882

#### Abbreviated ASCII Syntax:

```
INSCALIBRATE Offset [Trigger] [SDThreshold]
```

#### Abbreviated ASCII Example:

```
INSCALIBRATE RBV NEW 1.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INSCALIBRATE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Offset	ANT1	1	Use this option to set the INS calibration offset from the IMU to the primary GNSS antenna <b>Note:</b> The ANT1 option is available only on IMU Grade 2 or higher IMUs. See Models and Features in the <a href="#">OEM7 SPAN Installation and Operation User Manual</a> .	Enum	4	H
		ALIGN	8	Use this option to set the INS calibration offset from the IMU Body frame to ALIGN frame rotation.			
		RBV	11	Use this option to set the INS calibration offset from the IMU Body frame to Vehicle frame rotation.			

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
3	Trigger	STOP	0	Ends the INS calibration and applies the resulting estimate to the system.	Enum	4	H+4
		NEW	1	Begins a new calibration, overwriting any previous input.			
		ADD	2	Begins a new calibration, the results of which will be cumulatively averaged with previously calibrated offsets. <b>Note:</b> If no previous calibration is present, this trigger behaves as the NEW trigger.			
		RESET	3	Resets the current calibration process and removes it from the cumulative average computation. The previous inputs of calibrated values remain.			
4	SDThreshold			Standard Deviation Threshold (default for lever arm calibration = 0.10 m) (default for RBV and ALIGN calibration = 0.5 degrees)	Float	4	H+8

## 4.8 INSCOMMAND

### *INS Control Command*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to enable or disable INS. When INS is disabled, no INS position, velocity or attitude is output (however IMU data is still available). Also, INS aiding of tracking reacquisition is disabled. If the command is used to disable INS and then re-enable it, the INS system has to go through its alignment procedure (equivalent to issuing a **RESET** command). See the relevant SPAN User Manual for information about the SPAN alignment procedures.

**Message ID:** 379

**Abbreviated ASCII Syntax:**

```
INSCOMMAND action
```

**Abbreviated ASCII Example:**

```
INSCOMMAND ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INS COMMAND header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Action	RESET	0	Resets the GNSS/INS alignment without clearing the INS biases.	Enum	4	H
		DISABLE	1	Disables INS navigation.			
		ENABLE	2	Enables INS navigation where alignment initialization starts again if the Action parameter was previously set to DISABLE.			
		START_NO_TIME	3	Raw IMU data will begin to flow upon system startup. IMU data collection can begin before the receiver has a GNSS solution. (default)			
		START_FINE_TIME	4	RAWIMU data will only be output after the system reaches FINESTEERING.			
RESTART	5	Resets the GNSS/INS alignment and clears the INS biases.					

## 4.9 INSSEED

### *INS Seed Configuration*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This command enables or disables the saving and restoration of the last known SPAN solution from NVM.

**Message ID:** 1906

**Abbreviated ASCII Syntax:**

```
INSSEED Command [Validation]
```

**Abbreviated ASCII Example:**

```
INSSEED ENABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INSSEED Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Command	DISABLE	0	Disable the INS seed functionality	Enum	4	H
		ENABLE	1	Enable the INS seed functionality			
		CLEAR	2	Clear the currently saved seed value so it will not be used until re-saved			
3	Validation	VALIDATE	0	Validate INS Seed data using GNSS solution before injecting (default)	Enum	4	H+4
		INJECT	1	Force an NVM seed value (if available) to be used, without any validation.  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 5px auto;">  <p>Using this option to force the seed to be used can result in an unstable INS solution if the vehicle has moved. For advanced users only.</p> </div>			
4	Reserved				Ulong	4	H+8
5	Reserved				Ulong	4	H+12

## 4.10 INSTHRESHOLDS

### *Change the INS\_HIGH\_VARIANCE Threshold*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This command should only be used by advanced users of GNSS+INS.

The **INSTHRESHOLDS** command allows you to customize the criteria by which the system reports the inertial solution status. This criteria is used to determine whether the solution status is reported as `INS_SOLUTION_GOOD` or `INS_HIGH_VARIANCE`.

This command is useful in situations where system dynamics are known to be challenging.

**Message ID: 1448**

#### Abbreviated ASCII Syntax:

```
INSTHRESHOLDS ThresholdConfiguration
```

#### Abbreviated ASCII Example:

```
INSTHRESHOLDS DEFAULT
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INSTHRESHOLDS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Threshold Configuration	DEFAULT	0	Standard INS status threshold settings	Enum	4	H
		LOW	1	Low INS status threshold settings (only checks the Attitude standard deviation)			
3	Reserved				Double	8	H+4
4	Reserved				Double	8	H+12
5	Reserved				Double	8	H+20

## 4.11 INSZUPT

### *Request Zero Velocity Update*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to manually perform a Zero Velocity Update (ZUPT).

NovAtel's SPAN Technology System does ZUPTs automatically. It is not necessary to use this command under normal circumstances.

This command should only be used by advanced users of GNSS/INS and only when the system is truly stationary.

Applying a ZUPT while moving will result in severe instability of the solution.

**Message ID: 382**

**Abbreviated ASCII Syntax:**

INSZUPT

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	INSZUPT header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Reserved			This parameter is optional when using abbreviated ASCII syntax.	BOOL	4	H

## 4.12 RELINSAUTOMATION

### *Enables Relative INS on the Rover*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to configure the Relative INS plug and play feature on the rover receiver. RELINSAUTOMATION enables/disables the plug and play feature, sets the rover COM port to which the master receiver is connected, sets the baud rate for communication, sets the correction transfer rate and enables/disables sending the HEADINGEXTB/HEADINGEXT2B log back to the master receiver.

On issuing this command at the rover receiver, the rover will automatically sync with the master receiver and configure it to send corrections at the specified baud rate and specified data rate.

The recommended method for configuring Relative INS is to use the **RELINSCONFIG** command (see page 908).

This command should only be issued at the rover receiver.

if the rover receiver is not connected to the master receiver using a serial COM port, use the **RELINSCONFIG** command (see page 908).

To use the **RELINSAUTOMATION** command, the receiver requires a Relative INS capable model.

**Message ID:** 1763

#### Abbreviated ASCII Syntax:

```
RELINSAUTOMATION option [comport] [baudrate] [datarate] [headingextboption]
```

#### Abbreviated ASCII Example:

```
RELINSAUTOMATION enable com2 230400 10 on
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	RELINS AUTOMATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	option	ENABLE	0	Enables or disables the plug and play feature.	Enum	4	H
		DISABLE	1				

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
3	comport	COM1	1	The COM port on the rover receiver to which the master receiver is connected. (default = COM2)	Enum	4	H+4
		COM2	2				
		COM3	3				
4	baudrate	9600, 19200, 38400, 57600, 115200, 230400, 460800		The baud rate used for communication between the master and rover receivers.	Ulong	4	H+8
5	datarate	1, 2, 4, 5, 10 or 20 Hz		The rate at which corrections are transferred between the receivers. (default = 10 Hz)	Ulong	4	H+12
6	headingextb option	ON OFF		Enables or disables sending the HEADINGEXTB/ HEADINGEXT2B log back to the master receiver. (default = ON)	Enum	4	H+16

## 4.13 RELINSCONFIG

### Configure Relative INS

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to configure Relative INS on this receiver.

To use the **RELINSCONFIG** command, the receiver requires a Relative INS capable model.

**Message ID:** 1797

#### Abbreviated ASCII Syntax:

```
RELINSCONFIG enable rxtype [port] [baud] [rateinhz]
```

#### Abbreviated ASCII Example:

```
RELINSCONFIG ENABLE ROVER COM2 230400 10
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	RELINS CONFIG header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	enable	DISABLE	0	Enables or disables the Relative INS functionality.	Enum	4	H
		ENABLE	1				
3	rxtype	ROVER	1	Defines the receiver as the master or rover in a Relative INS configuration.	Enum	4	H+4
		MASTER	2				
4	port	See <i>Table 221: COM Ports</i> on the next page		Communication port used to communicate with the other receiver. (default = COM2)	Enum	4	H+8
5	baud	9600, 19200, 38400, 57600, 115200, 230400, 460800		The baud rate used for communication between the master and rover receivers. (default = 230400)	Ulong	4	H+12
6	rateinhz	1, 2, 4, 5, 10 or 20 Hz		The rate at which corrections are transferred between the receivers. (default = 10 Hz)	Ulong	4	H+16

Table 221: COM Ports

Decimal	ASCII	Description
1	COM1	COM port 1
2	COM2	COM port 2
3	COM3	COM port 3
13	USB1	USB port 1
14	USB2	USB port 2
15	USB3	USB port 3
19	COM4	COM port 4
23	ICOM1	IP virtual COM port 1
24	ICOM2	IP virtual COM port 2
25	ICOM3	IP virtual COM port 3
29	ICOM4	IP virtual COM port 4
31	COM5	COM port 5
46	ICOM5	IP virtual COM port 5
47	ICOM6	IP virtual COM port 6
48	ICOM7	IP virtual COM port 7
49	SCOM1	Scripted application COM port 1
50	SCOM2	Scripted application COM port 2
51	SCOM3	Scripted application COM port 3
52	SCOM4	Scripted application COM port 4

## 4.14 SETALIGNMENTORIENTATION

### *Enable or disable orientation verification*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This command enables or disables the orientation verification condition for INS alignment. If the detected enclosure frame roll or pitch exceeds the defined thresholds, INS alignment will not occur.

This command is specifically designed for use on smart antenna products where the GNSS antenna is rotating with the IMU and the customer wants to ensure the enclosure is in the proper orientation (right side up) prior to SPAN completing alignment.

**Message ID:** 2164

#### Abbreviated ASCII Syntax:

```
SETALIGNMENTORIENTATION switch [Roll/Pitch Threshold]
```

#### Abbreviated ASCII Example:

```
SETALIGNMENTORIENTATION ENABLE 60.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETALIGNMENT ORIENTATION header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Switch	Disable	0	Disable orientation check on INS alignment.	Enum	4	H
		Enable	1	Enable orientation check on INS alignment.			
3	Angle Threshold	0.0 - 90.0		Roll and pitch lower limit for preventing INS alignment (degrees, default = 60.0).	Double	8	H+4

## 4.15 SETALIGNMENTVEL

### *Set the Minimum Kinematic Alignment Velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use the **SETALIGNMENTVEL** command to adjust the minimum required velocity for a kinematic alignment.

Useful in cases, such as helicopters, where alignment velocity should be increased to prevent a poor alignment before the vehicle/aircraft is able to flight straight and level.

**Message ID: 1397**

**Abbreviated ASCII Syntax:**

```
SETALIGNMENTVEL velocity
```

**Abbreviated ASCII Example**

```
SETALIGNMENTVEL 5.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETALIGNMENTVEL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Velocity	Minimum: 0.2 m/s (Default is 5 m/s)		The minimum velocity, in m/s, required to kinematically align.	Double	8	H

## 4.16 SETHEAVEWINDOW

### *Set Heave Filter Length*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to control the length of the heave filter. This filter determines the heave (vertical displacement) of the IMU, relative to a long term level surface. This command does not control the DELAYEDHEAVE filter window.

**Message ID:** 1383

**Abbreviated ASCII Syntax:**

```
SETHEAVEWINDOW filterlength
```

**Abbreviated ASCII Example:**

```
SETHEAVEWINDOW 35
```

Field	Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETHEAVE WINDOW header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Filter Length	Integer (1 – 300 s) (default = 20 s)		This filter length will be used in the heave filter. Typically, set the filter length to 5 x wave period	Long	4	H

## 4.17 SETIMUEVENT

### *IMU Event Selection Command*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command is used to select the event used for timing the IMU data. IMUs that use a Time of Validity (ToV) signal send a pulse (using an Event IN) to the receiver. IMUs that synchronize the IMU clock with the receiver clock require a signal from the receiver (using an Event OUT).

**Message ID:** 1965

#### Abbreviated ASCII Syntax:

```
SETIMUEVENT Direction Event
```

#### Abbreviated ASCII Example:

```
SETIMUEVENT OUT EVENT3
```

Field	Field Type	ASCII Value	Binary Value	Description	Format	Binary Bytes	Binary Offset
1	SETIMUEVENT header	–	–	Command header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	Direction	IN	1	Direction of event <b>Note:</b> IN2 is only available on the OEM7500 and is intended for IMUs with multiple ToVs.	Enum	4	H
		OUT	2				
		IN2	3				
3	Event	OFF	1	The event to assign to the direction.  The DEFAULT event is EVENT2 for the IN direction and EVENT1 for the OUT direction.	Enum	4	H+4
		DEFAULT	2				
		EVENT1	3				
		EVENT2	4				
		EVENT3	5				
EVENT4	6						

## 4.18 SETIMUPORTPROTOCOL

### *Sets the Protocol Used for the IMU Serial Port*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use the **SETIMUPORTPROTOCOL** command to change the IMU serial port to use either RS-232 or RS-422 protocol. This overrides the default configured internally when the **CONNECTIMU** command is sent.

Before changing the IMU serial port protocol:

1. Make sure the receiver port connected to the IMU is capable of RS-422 protocol. Refer to the [OEM7 Installation and Operation User Manual](#) for information about the receiver serial ports.
2. The IMU data message is input into the receiver at that particular protocol.

**Message ID:** 1767

#### **Abbreviated ASCII Syntax:**

```
SETIMUPORTPROTOCOL SerialProtocol
```

#### **Abbreviated ASCII Example:**

```
SETIMUPORTPROTOCOL RS422
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETIMUPORT PROTOCOL header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Serial Protocol	RS232 RS422		The protocol for the IMU serial port.	Enum	4	H

## 4.19 SETIMUSPECS

### Specify Error Specifications and Data Rate

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This command should only be used by advanced users of GNSS/INS.

Use the **SETIMUSPECS** command to specify the error specifications and data rate for the desired IMU. If the default specs for the supported models are different than the unit used then this command can be used to override the default values.

This command is only available for the following IMUs:

- Honeywell HG1930 (default specifications are for the AA99/CA50 model)
- Honeywell HG1900 (default specifications are for the CA29/CA50 model)

**Message ID: 1295**

#### Abbreviated ASCII Syntax:

```
SETIMUSPECS DataRate AccelBias AccelVRW GyroBias GyroARW AccelSFError
GyroSFError [DataLatency]
```

#### Abbreviated ASCII Example: (iMAR-FSAS Specs)

```
SETIMUSPECS 200 1 .0198 0.75 0.0028 300 300 2.5
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETIMUSPECS header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Data Rate	100 Hz to 400 Hz		Data rate of the IMU	Ushort	2	H
3	Accel Bias	-		Total accelerometer bias in milli-g	Double	8	H+2
4	Accel VRW	-		Accelerometer velocity random walk in m/s/rt-hr	Double	8	H+10
5	Gyro Bias	-		Total gyroscope bias in deg/hr	Double	8	H+18
6	Gyro ARW	-		Gyroscope angular random walk in deg/rt-hr	Double	8	H+26
7	Accel Scale Factor Error	> 0		Accelerometer scale factor error in parts per million. Optional. Default = 1000 ppm.	Ulong	4	H+34
8	Gyro Scale Factor Error	> 0		Gyroscopic scale factor error in parts per million. Optional. Default = 1000 ppm.	Ulong	4	H+38

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
9	Data Latency	> 0		Time delay in milliseconds from the time of validity of the IMU data to the time the input pulse is received by the SPAN enabled receiver. This may include filtering delays, processing delays and transmission times depending on the timing method (TOV, ASYNC, SYNC) and the internal IMU handling. Optional. Default = 0.0.	Double	8	H+42
10	Reserved	SCALE_DEFAULT	0	Reserved. If using ASCII format, enter SCALE_DEFAULT. If using binary format, enter 0.	Enum	4	H+50
11	CRC	-		32-bit CRC	Hex	4	H+54

## 4.20 SETINITAZIMUTH

### *Set Initial Azimuth and Standard Deviation*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to start SPAN operation with a previously known azimuth. Azimuth is the weakest component of a coarse alignment and is also the easiest to know from an external source (i.e., like the azimuth of roadway). When using this command, SPAN operation through alignment will appear the same as with a usual coarse alignment. Roll and pitch is determined using averaged gyro and accelerometer measurements. The input azimuth is used rather than what is computed by the normal coarse alignment routine.

- Input azimuth values must be accurate for good system performance.
- Sending **SETINITAZIMUTH** resets the SPAN filter. Following realignment, vehicle dynamics are required for the filter to re-converge. Bridging performance is poor before filter convergence.
- The entered azimuth angle is with respect to the configured output frame. This is generally the vehicle frame unless a User Frame offset has been configured using the **SETINSROTATION** command (see page 919). All offsets should be entered before entering the **SETINITAZIMUTH** command.
- This command is not save configurable and must be re-entered after each start-up. The command can be entered at any time and will be used automatically when the system is ready to begin alignment.

Azimuth is positive in a clockwise direction when looking towards the z-axis origin.

**Message ID: 863**

**Abbreviated ASCII Syntax:**

```
SETINITAZIMUTH azimuth azSTD
```

**Abbreviated ASCII Example:**

```
SETINITAZIMUTH 90 5
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETINIT AZIMUTH header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	azimuth	0 to 360		Input azimuth angle (degrees)	Double	8	H
3	azSTD	1 to 25		Input azimuth standard deviation angle (degrees)	Float	4	H+8

## 4.21 SETINSPROFILE

### *Sets filter behavior depending on system environment*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This command sets specific filter behavior depending on the environment the system is installed in. The DEFAULT profile is the legacy setting from earlier SPAN products. The other profiles make changes specific to that environment.

See the [OEM7 SPAN Installation and Operation User Manual](#) for a detailed description of each profile's effect.

**Message ID:** 1944

#### Abbreviated ASCII Syntax:

```
SETINSPROFILE profile
```

#### Abbreviated ASCII Example:

```
SETINSPROFILE LAND
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETINS PROFILE Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Profile	Default	0	Default INS profile with standard SPAN behavior.	Enum	4	H
		LAND	1	INS profile for land vehicles			
		MARINE	2	INS profile for marine vehicles			
		FIXEDWING	3	INS profile for fixed wing aircraft			
		FOOT	4	INS profiles for walking/backpack applications			
		VTOL	5	INS profile for vertical takeoff and landing vehicles (UAVs, helicopters, etc.)			
		RAIL	6	INS profile for trains			
		AGRICULTURE	7	INS profile for agriculture applications			

## 4.22 SETINSROTATION

**Specifies rotational offsets between the IMU frame and other reference frames**

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use the **SETINSROTATION** command to specify rotational offsets between the IMU frame and other reference frames, such as the vehicle frame or an ALIGN baseline. Offsets must be entered as the rotation from the IMU body frame, to the frame of interest. The order of rotations is Z, X, Y. All rotations are right handed.

- It is very important to follow the order of rotations (Z, X, Y) when determining the rotations from IMU body frame to frame of interest.
- It is strongly recommended to enter meaningful standard deviations when entering an ALIGN or RBV rotation.

To specify translational offsets between frames, see the **SETINSTRANSULATION** command on page 922.

**Message ID: 1921**

### Abbreviated ASCII Syntax:

```
SETINSROTATION INSRotation XRotation YRotation ZRotation [XRotationSD]
[YRotationSD] [ZRotationSD]
```

### Abbreviated ASCII Example:

```
SETINSROTATION RBV 0 0 90 3.0 3.0 3.0
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETINSROTATION Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	INS Rotation	<i>Table 222: Rotational Offset Types</i> on the next page		Rotational offset to be set.	Enum	4	H
3	XRotation	±180		X rotation offset from IMU origin (degrees)	Float	4	H+4
4	YRotation	±180		Y rotation offset from IMU origin (degrees)	Float	4	H+8
5	ZRotation	±180		Z rotation offset from IMU origin (degrees)	Float	4	H+12

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
6	XRotationSD	0.25 to 45		Optional X rotation offset standard deviation (degrees). Applicable for RBV and ALIGN rotations. Default = 3.0.	Float	4	H+16
7	YRotationSD	0.25 to 45		Optional Y rotation offset standard deviation (degrees). Applicable for RBV and ALIGN rotations. Default = 3.0.	Float	4	H+20
8	ZRotationSD	0.25 to 45		Optional Z rotation offset standard deviation (degrees). Applicable for RBV and ALIGN rotations. Default = 3.0.	Float	4	H+24
9	Reserved				Long	4	H+28

Table 222: Rotational Offset Types

ASCII Value	Binary Value	Description
USER	4	Rotation from the IMU body frame to the user output frame. This offset shifts the attitude information in the INSPVA, INSPOS, INSVEL, INSATT, and INSSPD logs, along with their short header and extended versions.
MARK1	5	Rotation from the IMU body frame to the desired output for MARK1. This offset rotates the attitude information in the MARK1PVA log.
MARK2	6	Rotation from the IMU body frame to the desired output for MARK2. This offset rotates the attitude information in the MARK2PVA log.
ALIGN	8	Rotation from the IMU body frame to an ALIGN dual antenna solution. <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  When using a dual antenna ALIGN solution with SPAN, this offset will be calculated automatically if translational offsets to both the primary and secondary GNSS antennas are provided using the <b>SETINSTRANSLATION</b> command on page 922. </div>

ASCII Value	Binary Value	Description
MARK3	9	Rotation from the IMU body frame to the desired output for MARK3. This offset rotates the attitude information in the MARK3PVA log.
MARK4	10	Rotation from the IMU body frame to the desired output for MARK4. This offset rotates the attitude information in the MARK4PVA log.
RBV	11	Rotation from the IMU body frame to the vehicle frame.
RBM	12	Rotation from the IMU body frame to the gimbal mount body frame.

## 4.23 SETINSTRANSALATION

*Specifies translational offsets between the IMU frame and other reference frames*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use the **SETINSTRANSALATION** command to specify translational offsets between the IMU frame and other reference frames, including GNSS antennas or the desired output frame. Offsets must be entered as the vector from the IMU, to the frame or position of interest. Offsets can be entered either in the IMU body frame, or the vehicle frame; offsets in the vehicle frame will be automatically rotated into the IMU body frame using the best available IMU Body to Vehicle Rotation (RBV).

For details on entering the RBV rotation or other angular offsets, see the **SETINSROTATION** command on page 919.

**Message ID:** 1920

**Abbreviated ASCII Syntax:**

```
SETINSTRANSALATION INStranslation XTranslation YTranslation ZTranslation
[XTranslationSD] [YTranslationSD] [ZTranslationSD] [InputFrame]
```

**Abbreviated ASCII Example:**

```
SETINSTRANSALATION USER 1.0 2.0 3.0 0.05 0.05 0.05 VEHICLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETINS TRANSLATION Header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	InsTranslation	See Table 223: <i>Translation Offset Types</i> on the next page		Translation offset to be set	Enum	4	H
3	XTranslation	±100		X translation offset from IMU origin (m)	Float	4	H+4
4	YTranslation	±100		Y translation offset from IMU origin (m)	Float	4	H+8
5	ZTranslation	±100		Z translation offset from IMU origin (m)	Float	4	H+12
6	XTranslationSD	0 to 10		Optional X translation offset standard deviation (m)	Float	4	H+16
7	YTranslationSD	0 to 10		Optional Y translation offset standard deviation (m)	Float	4	H+20
8	ZTranslationSD	0 to 10		Optional Z translation offset standard deviation (m)	Float	4	H+24
9	InputFrame	Table 224: <i>Translation Input Frame</i> on page 924		Optional input frame for translation offset values	Enum	4	H+48

For the ANT1, ANT2, EXTERNAL and GIMBAL translations, the standard deviation defaults are set to 10% of the translation value (up to a max of 10 meters).

For USER, MARK1, MARK2, MARK3 and MARK4 translations, standard deviations values are not used in the solution.

Large standard deviations can lead to an inaccurate position solution. Therefore, it is highly recommended to measure translation offsets as accurately as possible and to manually enter translation offset standard deviations that reflect that accuracy.

It is important to keep in mind that as the user offset is moved further from the IMU center of navigation, the PVA solution will become noisier due to the projection of angular changes over a longer distance.

**Table 223: Translation Offset Types**

ASCII Value	Binary Value	Description
ANT1	1	Offset from the IMU center of navigation to the phase center of the primary GNSS antenna.
ANT2	2	Offset from the IMU center of navigation to the phase center of the secondary GNSS antenna.
EXTERNAL	3	Offset from the IMU center of navigation to the external position source location. This offset type is for use with the <b>EXTERNALPVAS</b> command (see page 892).
USER	4	Translation from the IMU center of navigation to the user output location. This offset shifts the position and velocity information in the INSPVA, INSPOS, INSVEL, INSATT, and INSSPD logs, along with their short header and extended versions.
MARK1	5	Translation from the IMU center of navigation to the MARK1 output location. This offset shifts the position and velocity information in the MARK1PVA log.
MARK2	6	Translation from the IMU center of navigation to the MARK2 output location. This offset shifts the position and velocity information in the MARK2PVA log.
GIMBAL	7	Translation from the IMU center of navigation to the gimbal mount center of rotation.
MARK3	9	Translation from the IMU center of navigation to the MARK3 output location. This offset shifts the position and velocity information in the MARK3PVA log.
MARK4	10	Translation from the IMU center of navigation to the MARK4 output location. This offset shifts the position and velocity information in the MARK4PVA log.

**Table 224: Translation Input Frame**

ASCII Value	Binary Value	Description
IMUBODY	0	Offset is provided in the IMU enclosure frame. Default: IMUBODY
VEHICLE	1	Offset is provided in the vehicle frame. Offsets entered in the vehicle frame will be automatically rotated into the IMU frame using the best available RBV (rotation from IMU Body to Vehicle) information when required. Vehicle frame offsets should only be used if the RBV is known accurately, either through user measurement or calibration. The order of entry for vehicle frame offsets and the RBV rotation does not matter.

## 4.24 SETINSUPDATE

### *Enable/Disable INS Filter Updates*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This command should only be used by advanced users of GNSS+INS.

Use this command to enable or disable the available INS filter updates.

**Message ID:** 1821

**Abbreviated ASCII Syntax:**

```
SETINSUPDATE INSUpdate Trigger
```

**Abbreviated ASCII Example:**

```
SETINSUPDATE ZUPT DISABLE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETINSUPDATE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	INSUpdate	POS	0	Position updates	Enum	4	H
		ZUPT	1	Zero velocity updates			
		PSR	2	Pseudorange updates			
		ADR	3	Carrier phase updates			
		DOPPLER	4	Doppler updates			
		ALIGN	5	Heading updates			
3	Trigger	DISABLE	0	Disable the INS update specified in the INSUpdate field.	Enum	4	H+4
		ENABLE	1	Enable the INS update specified in the INSUpdate field.			

## 4.25 SETMAXALIGNMENTTIME

### *Set a Time Limit for Static Course Alignment*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to set a maximum time limit allowed for static coarse alignments. Coarse alignments typically take under 60 seconds, but in heavy vibration conditions they can take much longer trying to compensate for the vibration induced noise. This command is used to cap the time to a specific length.

This command is for advanced users only.  
Alignment accuracy cannot be guaranteed if the alignment time is capped using this command.

**Message ID:** 1800

#### Abbreviated ASCII Syntax:

```
SETMAXALIGNMENTTIME switch [duration]
```

#### Abbreviated ASCII Example:

```
SETMAXALIGNMENTTIME ENABLE 90
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETMAX ALIGNMENTTIME header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	switch	DISABLE	0	Disables the static alignment time limit.	Enum	4	H
		ENABLE	1	Enables the static alignment time limit.			
3	duration	30 - 300		Maximum static alignment time in seconds. Default is 180.	Ulong	4	H+4

## 4.26 SETRELINSOUTPUTFRAME

### *Sets the Relative INS Output Frame*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this command to change the frame of the output solution provided in the RELINSPVA and SYNCRELINSPVA logs. See **RELINSPVA** log on page 1041 and **SYNCRELINSPVA** log on page 1045 for information about these logs.

See in the [OEM7 SPAN Installation and Operation User Manual](#) for information about the Relative INS functionality.

**Message ID:** 1775

#### Abbreviated ASCII Syntax:

```
SETRELINSOUTPUTFRAME OutputFrame [DiffCriteria]
```

#### Abbreviated ASCII Example:

```
SETRELINSOUTPUTFRAME ECEF TRUE
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETRELINS OUTPUTFRAME header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	OutputFrame	ROVER	1	Frame of the output solution in the RELINSPVA and SYNCRELINSPVA logs.	Enum	4	H
		MASTER	2	ROVER – the output frame of the rover INS solution			
		ECEF	3	MASTER – the output frame of the master INS solution ECEF – Earth Centered Earth Fixed			
		LOCALLEVEL	4	LOCALLEVEL – Local level The default is the ROVER.			
3	DiffCriteria	FALSE	0	The delta solution is computed as Rover minus Master. (default)	Bool	1	H+4
		TRUE	1	The delta solution is computed as Master minus Rover.			

## 4.27 SETUPSENSOR

### *Add a new sensor object*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to add a new sensor object to the system. A sensor object consists of an ID, an Event\_Out line and an Event\_In line. This is intended as a simplified way to set up triggering to and from a sensor rather than configuring all connections independently. It also allows for event pulses to be sent to a sensor at specific GPS times (see the **TIMEDEVENTPULSE** command on page 931).

**Message ID:** 1333

#### Abbreviated ASCII Syntax:

```
SETUPSENSOR SensorID EventOut OPP OAP EventIn EIC IPP ITB MITG
```

#### Abbreviated ASCII Example:

```
SETUPSENSOR SENSOR3 MARK1 POSITIVE 2 MARK4 EVENT POSITIVE 0 2
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	SETUP SENSOR header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Sensor ID	SENSOR1	0	The sensor to configure.	Enum	4	H
		SENSOR2	1				
		SENSOR3	2				
3	EventOut	MARK1	0	Associate a specific MARK Event_Out line to this sensor configuration.	Enum	4	H+4
		MARK2	1				
		MARK3	2				
		MARK4	3				
4	OPP	NEGATIVE	0	Mark output pulse polarity	Enum	4	H+8
		POSITIVE	1				
5	OAP	2 - 500		Mark output active period in milliseconds. Value must be divisible by 2.	Ulong	4	H+12
6	EventIn	MARK1	0	Associate a specific MARK Event_In line to this sensor configuration.	Enum	4	H+16
		MARK2	1				
		MARK3	2				
		MARK4	3				

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
7	EIC	DISABLE	0	Event in control	Enum	4	H+20
		EVENT	1				
8	IPP	NEGATIVE	0	Mark input pulse polarity	Enum	4	H+24
		POSITIVE	1				
9	ITB	-99999999 to 99999999		Mark input time bias in milliseconds	Long	4	H+28
10	ITG	2 to 3599999		Mark input time guard in milliseconds	Ulong	4	H+32

The Event\_In and Event\_Out options available are dependent on the receiver used in the SPAN system. For information about the Event lines supported, see the Strobe Specifications for the receiver in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#), or [SPAN CPT7 Installation and Operation User Manual](#).

MARK3 and MARK4 are available only on SPAN systems with an OEM7600, OEM7700 or OEM7720 receiver.

## 4.28 TAGNEXTMARK

### *Tags the Next Incoming Mark Event*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to tag the next incoming mark event on the selected mark with a 32-bit number. This is available in the **TAGGEDMARK1PVA**, **TAGGEDMARK2PVA**, **TAGGEDMARK3PVA** and **TAGGEDMARK4PVA** log (see page 1048) to easily associate the PVA log with a supplied event.

**Message ID:** 1257

**Abbreviated ASCII Syntax:**

```
TAGNEXTMARK Mark Tag
```

**Abbreviated ASCII Example:**

```
TAGNEXTMARK MARK1 1234
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	TAGNEXTMARK header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Mark	MARK1	0	Event line	Enum	4	H
		MARK2	1				
		MARK3	2				
		MARK4	3				
3	Tag	-	-	Tag for next mark event	Ulong	4	H+4

The Mark options available are dependent on the receiver used in the SPAN system. For information about the Event lines supported, see the Strobe Specifications for the receiver in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#), [SPAN CPT7 Installation and Operation User Manual](#) or [SMART7 Installation and Operation User Manual](#).

## 4.29 TIMEEVENTPULSE

### *Add a new camera event*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Use this command to add a new camera event to the system. **TIMEEVENTPULSE** sends a pulse on the sensor MARK output at the selected GPS time and sets the trigger on the sensor MARK input to be tagged with an event ID (see the **TAGGEDMARK1PVA**, **TAGGEDMARK2PVA**, **TAGGEDMARK3PVA** and **TAGGEDMARK4PVA** log on page 1048). The lines connected to each sensor are configured using the **SETUPSENSOR** command (see page 928).

A maximum of 10 unprocessed events can be buffered into the system. A **TIMEEVENTPULSE** command must be entered at least 1 second prior to the requested event time.

**Message ID:** 1337

#### Abbreviated ASCII Syntax:

```
TIMEEVENTPULSE SensorID GPSWeek GPSSeconds [Event ID]
```

#### Abbreviated ASCII Example:

```
TIMEEVENTPULSE -1 1617 418838 100
```

Field	Field Type	ASCII Value	Binary Value	Description	Binary Format	Binary Bytes	Binary Offset
1	TIMED EVENT PULSE header	-	-	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Sensor ID	ALL	-1 (0xFFFFFFFF)	The sensor(s) affected by the trigger command.	Long	4	H
		SENSOR1	0x01	The decimal representation of the combination of bits 0-2 can be used to select a combination of active sensors (e.g. 5 [101] will select sensors 1 and 3).			
		SENSOR2	0x02				
		SENSOR3	0x04				
3	GPS Week	0 - MAX Ulong		The GPS week that triggers the event.	Ulong	4	H+4
4	GPS Seconds	0 - 604800		The GPS week seconds that triggers the event.	Double	8	H+8
5	Event ID	0 - MAX Ulong		The event's identifier, used to tag the TAGGEDMARKxPVA logs if a sensor input is enabled. Optional Default = 0	Ulong	4	H+16

## Chapter 5 SPAN Logs

The SPAN specific logs follow the same general logging scheme as normal OEM7 Family logs. They are available in ASCII or binary formats and are defined as being either synchronous or asynchronous. All the logs in this chapter are used only with the SPAN system.

For information on other available logs and output logging, refer to *Logs* on page 399.

One difference from the standard OEM7 Family logs is there are two possible headers for the ASCII and binary versions of the logs. Which header is used for a given log is described in the log definitions in this chapter. The reason for the alternate short headers is that the normal OEM7 binary header is quite long at 28 bytes. This is nearly as long as the data portion of many of the INS logs and creates excess storage and baud rate requirements. Note that the INS related logs contain a time tag within the data block in addition to the time tag in the header. The time tag in the data block should be considered the exact time of applicability of the data. All INS Position, Velocity and Attitude logs can be obtained at a rate of up to 200 Hz. The standard deviation and update logs are available once per second.

Each ASCII log ends with a hexadecimal number preceded by an asterisk and followed by a line termination using the carriage return and line feed characters, for example, **\*1234ABCD[CR][LF]**. This value is a 32-bit CRC of all bytes in the log, excluding the '#' or '%' identifier and the asterisk preceding the four checksum digits. See also *Description of ASCII and Binary Logs with Short Headers* on page 44.

*Table 225: Inertial Solution Status* on page 955 shows the status values included in the INS position, velocity and attitude output logs. If the IMU is connected properly and a good status value is not being received, check the hardware setup to ensure it is properly connected. This situation can be recognized in the RAWIMU data by observing accelerometer and gyro values which are not changing with time.

### Logging Restriction Important Notice

Logging excessive amounts of high rate data can overload the system. When configuring the output for SPAN, NovAtel recommends that only one high rate (>50Hz) message be configured for output at a time. It is possible to log more than one message at high rates, but doing so could have negative impacts on the system. Also, if logging 100/125/200Hz data, always use the binary format and, if possible, the short header binary format (available on most INS logs).

For optimal performance, log only one high rate output at a time. These logs could be:

- Raw data for post processing  
RAWIMUXSB ONNEW
  - RAWIMU logs are not valid with the ONTIME trigger. The raw IMU observations contained in these logs are sequential changes in velocity and rotation. As such, you can only use them for navigation if they are logged at their full rate.
- Real time INS solution  
IMURATEPVA ONNEW or IMURATEPVAS ONNEW  
  
Other possible INS solution logs available at high rates are: INSPVASB, INSPOSSB, INSVELSB, INSATTSB

The periods available when using the ONTIME trigger are 0.005 (200 Hz), 0.01 (100 Hz), 0.02 (50 Hz), 0.05, 0.1, 0.2, 0.25, 0.5, 1, and any integer number of seconds.

## 5.1 Logs with INS or GNSS Data

There are several logs in the system designed to output the best available solution as well as many logs that output only a specific solution type (PSR, RTK, INS, etc). The table below lists the logs that can provide either a GNSS solution or an INS solution. Most of these derive from the solution the system picks as the best solution. SPAN systems also have a secondary best solution that derives from the GNSS solution only (**BESTGNSSPOS** log (see page 934) and **BESTGNSSVEL** log (see page 936)). The position output from these logs is at the phase center of the antenna.

Log	Log Format	GNSS/INS
BESTPOS	NovAtel	YES
BESTVEL	NovAtel	YES
BESTUTM	NovAtel	YES
BESTXYZ	NovAtel	YES
GPGGA	NMEA	YES
GPGLL	NMEA	YES
GPRMC	NMEA	Yes
GPVTG	NMEA	YES

## 5.2 BESTGNSSPOS

### *Best GNSS Position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the best available GNSS position (without INS) computed by the receiver. In addition, it reports several status indicators, including differential age, which is useful in predicting anomalous behavior brought about by outages in differential corrections. A differential age of 0 indicates that no differential correction was used.

With the system operating in an RTK mode, this log reflects the latest low latency solution for up to 60 seconds after reception of the last base station observations. After this 60 second period, the position reverts to the best solution available and the degradation in accuracy is reflected in the standard deviation fields. If the system is not operating in an RTK mode, pseudorange differential solutions continue for the time specified in the **PSRDIFFTIMEOUT** command (see page 274).

BESTGNSSPOS always outputs positions at the antenna phase center.

**Message ID:** 1429

**Log Type:** Synch

**Recommended Input:**

```
log bestgnssposa ontime 1
```

**ASCII Example:**

```
#BESTGNSSPOSA,COM1,0,92.5,FINESTEERING,1692,332119.000,02000000,8505,43521;

## 5.3 BESTGNSSVEL

### *Best Available GNSS Velocity Data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the best available GNSS velocity information (without INS) computed by the receiver. In addition, it reports a velocity status indicator, which is useful to indicate whether or not the corresponding data is valid. The velocity measurements sometimes have a latency associated with them. The time of validity is the time tag in the log minus the latency value.

The velocity is typically computed from the average change in pseudorange over the time interval or the RTK Low Latency filter. As such, it is an average velocity based on the time difference between successive position computations and not an instantaneous velocity at the BESTGNSSVEL time tag. The velocity latency to be subtracted from the time tag is normally half the time between filter updates. Under default operation, the positioning filters are updated at a rate of 2 Hz. This translates into a velocity latency of 0.25 seconds. The latency is reduced by increasing the update rate of the positioning filter used by requesting the BESTGNSSVEL or BESTGNSSPOS messages at a rate higher than 2 Hz. For example, a logging rate of 10 Hz reduces the velocity latency to 0.005 seconds. For integration purposes, the velocity latency should be applied to the record time tag.

A valid solution with a latency of 0.0 indicates the instantaneous Doppler measurement was used to calculate velocity.

**Message ID:** 1430

**Log Type:** Synch

**Recommended Input:**

```
log bestgnssvela ontime 1
```

**ASCII Example:**

```
#BESTGNSSVELA,COM1,0,91.5,FINESTEERING,1692,332217.000,02000000,00b0,43521;SOL_
COMPUTED,DOPPLER_VELOCITY,0.150,0.000,0.0168,323.193320,0.0232,0.0*159c13ad
```

9	Reserved		Float	4	H+40
10	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+44
11	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.4 CORRIMUDATA

### *Corrected IMU Measurements*

Platform: OEM719, OEM7500, OEM7700, SMART7-S, SMART7-SI

The **CORRIMUS** log on page 942 was introduced in firmware version OEM 7.07.0x and is designed to replace the **CORRIMUDATA** and **CORRIMUDATAS** logs. It is recommended to upgrade to **CORRIMUS** log on page 942 when collecting corrected IMU measurements synchronously. The **CORRIMUDATA** and **CORRIMUDATAS** logs are still available, but will eventually be phased out.

The CORRIMUDATA log contains the raw IMU data corrected for gravity, the earth's rotation and estimated sensor errors. The values in this log are incremental values, accumulated over the logging interval of CORRIMUDATA, in units of radians for the attitude rate and m/s for the accelerations. Data output is not in the IMU Body frame, but is automatically rotated into the user configured output frame (configured with the **SETINSROTATION** command (see page 919), default Vehicle frame).

The short header format, CORRIMUDATAS, is recommended, as it is for all high data rate logs.

CORRIMUDATA can be logged with the ONTIME trigger, up to a rate of 200 Hz.

Since the CORRIMUDATA log is synchronous, if you log at a rate less than full data rate of the IMU, the corrected IMU data is accumulated to match the requested time interval. For asynchronous, full rate data, see the **IMURATECORRIMUS** log on page 948.

To obtain the instantaneous rates of acceleration (in m/s/s) or rotation (in rad/s) from the output values of measurements per sample rate (m/s/sample and rad/sample), multiply the output values by the CORRIMUDATA logging rate in Hz.

**Message ID: 812**

**Log Type: Synch**

**Recommended Input:**

```
log corrimudatab ontime 0.01
```

**Example log:**

```
#CORRIMUDATAA,COM1,0,77.5,FINESTEERING,1769,237601.000,02000020,bdba,12597;
1769,237601.000000000,-0.000003356,0.000002872,0.000001398,0.000151593,
0.000038348,-0.000078820*1f7eb709
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	CORRIMUDATA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS week	Ulong	4	H+
3	Seconds	GNSS seconds from week start	Double	8	H+4
4	PitchRate	About x axis rotation (right-handed) (rad/sample)	Double	8	H+12
5	RollRate	About y axis rotation (right-handed) (rad/sample)	Double	8	H+20
6	YawRate	About z axis rotation (right-handed) (rad/sample)	Double	8	H+28
7	LateralAcc	INS Lateral Acceleration (along x axis) (m/s/sample)	Double	8	H+36
8	LongitudinalAcc	INS Longitudinal Acceleration (along y axis) (m/s/sample)	Double	8	H+44
9	VerticalAcc	INS Vertical Acceleration (along z axis) (m/s/sample)	Double	8	H+52
10	xxxx	32-bit CRC	Hex	4	H+56
11	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.5 CORRIMUDATAS

### Short Corrected IMU Measurements

Platform: OEM719, OEM7500, OEM7700, SMART7-S, SMART7-SI

The **CORRIMUS** log on page 942 was introduced in firmware version OEM 7.07.0x and is designed to replace the **CORRIMUDATA** and **CORRIMUDATAS** logs. It is recommended to upgrade to **CORRIMUS** log on page 942 when collecting corrected IMU measurements synchronously. The **CORRIMUDATA** and **CORRIMUDATAS** logs are still available, but will eventually be phased out.

This log is the short header version of the **CORRIMUDATA** log (see page 938).

To obtain the instantaneous rates of acceleration (in m/s/s) or rotation (in rad/s) from the output values of measurements per sample rate (m/s/sample and rad/sample), multiply the output values by the **CORRIMUDATAS** logging rate in Hz.

**Message ID: 813**

**Log Type: Synch**

**Recommended Input:**

```
log corrimudatasb ontime 0.01
```

**Example log:**

```
%CORRIMUDATASA,1581,341553.000;1581,341552.997500000,-0.000000690,-0.000001549,0.000001654,0.000061579,-0.000012645,-0.000029988*770c6232
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	CORRIMUDATAS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS week	Ulong	4	H+
3	Seconds	GNSS seconds from week start	Double	8	H+4
4	PitchRate	About x-axis rotation (right-handed) (rad/sample)	Double	8	H+12
5	RollRate	About y-axis rotation (right-handed) (rad/sample)	Double	8	H+20
6	YawRate	About z-axis rotation (right-handed) (rad/sample)	Double	8	H+28
7	LateralAcc	INS Lateral Acceleration (along x-axis) (m/s/sample)	Double	8	H+36

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	LongitudinalAcc	INS Longitudinal Acceleration (along y-axis) (m/s/sample)	Double	8	H+44
9	VerticalAcc	INS Vertical Acceleration (along z-axis) (m/s/sample)	Double	8	H+52
10	xxxx	32-bit CRC	Hex	4	H+56
11	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.6 CORRIMUS

### *Corrected IMU Measurements*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The **CORRIMUS** log replaces the **CORRIMUDATA** and **CORRIMUDATAS** logs.

The **CORRIMUS** log contains the raw IMU data corrected for gravity, the earth's rotation and estimated sensor errors. The values in this log are incremental values, accumulated over the logging interval of **CORRIMUS**, in units of radians for the attitude rate and m/s for the accelerations. Data output is not in the IMU Body frame, but is automatically rotated into the user configured output frame (configured with the **SETINSROTATION** command (see page 919), default is Vehicle frame).

The **CORRIMUS** log uses the short header format and can be used for high data rate logs. **CORRIMUS** can be logged with the ONTIME trigger, up to a rate of 200 Hz.

Since the **CORRIMUS** log is synchronous, if you log at a rate less than full data rate of the IMU, the corrected IMU data is accumulated to match the requested time interval. For asynchronous, full rate data, see the **IMURATECORRIMUS** log on page 948.

To obtain the instantaneous rates of acceleration (in m/s/s) or rotation (in rad/s) from the output values of measurements per sample rate (m/s/sample and rad/sample); multiply the output values by: **1 / (IMUDataCount \* IMUSpacing)**. IMUSpacing is the expected time between IMU Samples, computed via **1/IMUDataRate**.

Due to IMU data being handled asynchronously and being accumulated into a synchronous log there are numerous use cases that cause an inconsistent number of samples being used in the accumulated output.

**Message ID: 2264**

**Log Type: Synch**

**Recommended Input:**

```
log corrimusb ontime 0.01
```

**Example log:**

```
%CORRIMUSA,2023,340847.070;1,0.0000014373087865,-0.0000004823212266,

## 5.7 DELAYEDHEAVE

### *Delayed Heave Filter*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log contains the value of the delayed heave filter. The delayed heave value differs from the heave value in that delayed heave uses forward and backward smoothing, while heave uses backward smoothing only. This heave solution is calculated at the location entered in the **SETINSTRLATION USER** command.

The **DELAYEDHEAVE** log will not contain valid data until the delayed heave window conditions have been met. You must have an inertial solution to use this log.

**Message ID:** 1709

**Log Type:** Synch

**Recommended Input:**

```
log delayedheaveb ontime 0.1
```

**ASCII example:**

```
#DELAYEDHEAVEA, COM1, 0, 72.0, FINESTEERING, 1769, 237598.000, 02000020, 27a3, 12597; 0.0  
00080643, 0.086274510*85cdb46d
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	DELAYEDHEAVE Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Delayed Heave	Delayed heave value	Double	8	H
3	Std. Dev.	Standard deviation of the delayed heave value	Double	8	H+8
4	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+16
5	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.8 GIMBALLEDPVA

### *Display Gimballed Position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use the GIMBALLEDPVA log to view the re-calculated position, velocity and attitude of the gimbal null position whenever a new **INPUTGIMBALANGLE** command (see page 896) is received.

This log should only be requested with the ONCHANGED or ONTIME trigger.

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 1321

**Log Type:** Asynch

**Recommended Input:**

```
log gimballedpvaa onchanged
```

**ASCII Example:**

```
#GIMBALLEDPVAA,COM1,0,93.5,FINESTEERING,1635,320568.514,02000000,0000,407;1635,
320568.514000000,51.116376614,-114.038259915,1046.112025828,-0.000291756,

15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.9 HEAVE

### *Heave Filter Log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log provides vessel heave computed by the integrated heave filter. Refer also to information in the **SETHEAVEWINDOW** command on page 912. This log is asynchronous, but is available at approximately 10 Hz. This heave solution is calculated at the location entered in the **SETINSTRLATION USER** command.

You must have an inertial solution to use this log.

**Message ID:** 1382

**Log Type:** Asynch

**Recommended Input:**

```
log heaveb onnew
```

**Example:**

```
#HEAVEA,USB1,0,38.5,FINESTEERING,1630,232064.599,02000000,a759,6696;1630,232064.589885392,0.086825199*93392cb4
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	HEAVE Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Heave	Instantaneous heave in meters	Double	8	H+12
5	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+20
6	[CR][LF]	Sentence Terminator (ASCII Only)	-	-	-

## 5.10 IMURATECORRIMUS

### *Asynchronous Corrected IMU Data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the same information as the **CORRIMUS** log (see page 942), but is available asynchronously at the full rate of the IMU.

Using this log consumes significant system resources and should only be used by experienced users.

However, using this log consumes less resources than logging the synchronous CORRIMUDATAS log at the same rate.

To obtain the instantaneous rates of acceleration (in m/s/s) or rotation (in rad/s) from the output values of measurements per sample rate (m/s/sample and rad/sample), multiply the output values by the IMU data rate in Hz.

This log should only be requested with the ONNEW trigger.

**Message ID: 1362**

**Log Type: Asynch**

**Recommended Input:**

```
log imuratecorrimbusb onnew
```

**Example log:**

```
%IMURATECORRIMUSA,1581,341553.000;1581,341552.997500000,-0.000000690,-0.000001549,0.000001654,0.000061579,-0.000012645,-0.000029988*770c6232
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	IMURATECORRIMUS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS week	Ulong	4	H+

## 5.11 IMURATEPVA

### *Asynchronous INS Position, Velocity and Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the same information as the **INSPVA** log (see page 973), but is available asynchronously at the full rate of the IMU.

Using this log consumes significant system resources and should only be used by experienced users. However, using this log consumes less resources than logging the synchronous INSPVA log at the same rate.

This log should only be requested with the ONNEW trigger.

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 1778

**Log Type:** Asynch

**Recommended Input:**

```
log imuratepvaa onnew
```

**ASCII Example:**

```
#IMURATEPVAA, COM1, 0, 57.0, FINESTEERING, 1802, 320345.180, 02000000, 9b1f, 12987;1802, 320345.180000030, 51.11695246671, -114.03897779953, 1047.6905, -0.2284, 0.0076, 0.2227, 0.160588332, -0.039823409, 269.988184416, INS_ALIGNMENT_COMPLETE*f60016a6
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	IMURATEPVA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds	Seconds from week start	Double	8	H+4
4	Latitude	Latitude [degrees]	Double	8	H+12
5	Longitude	Longitude [degrees]	Double	8	H+20
6	Height	Ellipsoidal Height [m]	Double	8	H+28
7	North Velocity	Velocity in a northerly direction (a -ve value implies a southerly direction) [m/s]	Double	8	H+36

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	East Velocity	Velocity in an easterly direction (a -ve value implies a westerly direction) [m/s]	Double	8	H+44
9	Up Velocity	Velocity in an up direction [m/s]	Double	8	H+52
10	Roll	Right-handed rotation from local level around y-axis in degrees	Double	8	H+60
11	Pitch	Right-handed rotation from local level around x-axis in degrees	Double	8	H+68
12	Azimuth	Left-handed rotation around z-axis in degrees clockwise from North This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+76
13	Status	INS Status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+84
14	xxxx	32-bit CRC	Hex	4	H+88
15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.12 IMURATEPVAS

### *Asynchronous INS Position, Velocity and Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the same information as the **INSPVAS** log (see page 977), but is available asynchronously at the full rate of the IMU.

Using this log consumes significant system resources and should only be used by experienced users. However, using this log consumes less resources than logging the synchronous INSPVAS log at the same rate.

This log should only be requested with the ONNEW trigger.

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 1305

**Log Type:** Asynch

**Recommended Input:**

```
log imuratepvasa onnew
```

**ASCII Example:**

```
%IMURATEPVASA,1264,144059.000;1264,144059.002135700,51.116680071,

15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.13 INSATT

### *INS Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the most recent attitude measurements computed by the SPAN filter. This attitude definition may not correspond to other definitions of the terms pitch, roll and azimuth. By default, the output attitude is with respect to the vehicle frame. If the attitude output is desired with respect to another frame of reference, use the **SETINSROTATION USER** command (see the **SETINSROTATION** command on page 919) to configure the user output frame offset rotation.

**Message ID:** 263

**Log Type:** Synch

**Recommended Input:**

```
log insatta ontime 1
```

**ASCII Example:**

```
#INSATTA,USB2,0,14.5,FINESTEERING,1541,487970.000,02040000,5b35,37343;1541,487970.000549050,1.876133508,-4.053672765,328.401460897,INS_SOLUTION_GOOD*ce4ac533
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSATT Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Roll	Right-handed rotation from local level around y-axis in degrees.	Double	8	H+12
5	Pitch	Right-handed rotation from local level around x-axis in degrees.	Double	8	H+20
6	Azimuth	Left-handed rotation around z-axis in degrees clockwise from North. This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on the next page.	Enum		H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex		H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

Table 225: Inertial Solution Status

Binary	ASCII	Description
0	INS_INACTIVE	IMU logs are present, but the alignment routine has not started; INS is inactive.
1	INS_ALIGNING	INS is in alignment mode.
2	INS_HIGH_VARIANCE	<p>The INS solution is in navigation mode but the azimuth solution uncertainty has exceeded the threshold. The default threshold is 2 degrees for most IMUs. The solution is still valid but you should monitor the solution uncertainty in the <b>INSSTDEV</b> log (see page 987). You may encounter this state during times when the GNSS, used to aid the INS, is absent.</p> <p>The INS solution uncertainty contains outliers and the solution may be outside specifications.<sup>1</sup> The solution is still valid but you should monitor the solution uncertainty in the <b>INSSTDEV</b> log (see page 987). It may be encountered during times when GNSS is absent or poor.</p>
3	INS_SOLUTION_GOOD	The INS filter is in navigation mode and the INS solution is good.
6	INS_SOLUTION_FREE	<p>The INS filter is in navigation mode and the GNSS solution is suspected to be in error.</p> <p>This may be due to multipath or limited satellite visibility. The inertial filter has rejected the GNSS position and is waiting for the solution quality to improve.</p>
7	INS_ALIGNMENT_COMPLETE	The INS filter is in navigation mode, but not enough vehicle dynamics have been experienced for the system to be within specifications.
8	DETERMINING_ORIENTATION	INS is determining the IMU axis aligned with gravity.
9	WAITING_INITIALPOS	The INS filter has determined the IMU orientation and is awaiting an initial position estimate to begin the alignment process.
10	WAITING_AZIMUTH	The INS filter has orientation, initial biases, initial position and valid roll/pitch estimated. Will not proceed until initial azimuth is entered.
11	INITIALIZING_BIASES	The INS filter is estimating initial biases during the first 10 seconds of stationary data.
12	MOTION_DETECT	The INS filter has not completely aligned, but has detected motion.
14	WAITING_ALIGNMENTORIENTATION	<p>The INS filter is waiting to start alignment until the current Vehicle Frame roll and pitch estimates are within the configured threshold of the expected orientation (set by the <b>SETALIGNMENTORIENTATION</b> command on page 910).</p> <p><b>Note:</b> This requires an accurate RBV rotation to be configured, see the <b>SETINSROTATION</b> command on page 919.</p>

<sup>1</sup>The solution uncertainty threshold levels can be adjusted using the **INSTHRESHOLDS** command on page 904.

## 5.14 INSATTQS

### Short INS Quaternion Attitude

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the attitude from the INSATT log, but the rotation from local level is given as a Quaternion rather than Euler Angles. The quaternion takes the form:

$$\mathbf{q}_i^b = [w \ x \ y \ z]^T$$

The element  $w$  is the rotational component, defining the magnitude of the rotation to be performed. The elements  $x$ ,  $y$ , and  $z$  are the vector portion of the rotation, which define the axis about which the rotation is to be performed.

If  $\theta$  is the rotational angle, and the axis of rotation is defined by the vector  $\mathbf{v} = [v_x \ v_y \ v_z]^T$ , then the elements of the quaternion can be written as:

$$w = \cos \frac{\theta}{2}$$

$$x = v_x \sin \frac{\theta}{2}$$

$$y = v_y \sin \frac{\theta}{2}$$

$$z = v_z \sin \frac{\theta}{2}$$

**Message ID:** 2118

**Log Type:** Synch

**Recommended Input:**

```
log insattqsa ontime 1
```

**ASCII Example:**

```
%INSATTQSA,1943,425090.000;1943,425090.000000000,0.706276782,0.001974400,-0.001083571,-0.707932225,INS_ALIGNMENT_COMPLETE*552d93f0
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSATTQS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Quaternion w	Quaternion rotation from local level, w component	Double	8	H+12
5	Quaternion x	Quaternion rotation from local level, x component	Double	8	H+20
6	Quaternion y	Quaternion rotation from local level, y component	Double	8	H+28

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7	Quaternion z	Quaternion rotation from local level, z component	Double	8	H+36
8	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+44
9	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+48
10	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.15 INSATTS

### *Short INS Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSATT** log (see page 954).

**Message ID:** 319

**Log Type:** Synch

**Recommended Input:**

```
log insattsa ontime 1
```

**ASCII Example:**

```
%INSATTSA,1541,487975.000;1541,487975.000549050,2.755452422,-4.127365126,323.289778434,INS_SOLUTION_GOOD*ba08754f
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSATTS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Roll	Right-handed rotation from local level around y-axis in degrees	Double	8	H+12
5	Pitch	Right-handed rotation from local level around x-axis in degrees	Double	8	H+20
6	Azimuth	Left-handed rotation around z-axis in degrees clockwise from North This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.16 INSATTX

### *Inertial Attitude – Extended*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log includes the information from the **INSATT** log (see page 954), as well as information about the attitude standard deviation. The position type and solution status fields indicate whether or not the corresponding data is valid.

The INSATTX log is a large log and is not recommend for high rate logging.

If you want to use high rate logging, log the **INSATTS** log at a high rate and the **INSSTDEVS** log ontime 1.og and is not recommend for high rate logging.

**Message ID:** 1457

**Log Type:** Synch

**Recommended Input:**

```
log insattxa ontime 1
```

**ASCII Example:**

```
#INSATTXA, COM4, 0, 48.5, FINESTEERING, 2088, 169973.000, 02004020, 5d25, 15823;

## 5.17 INSCALSTATUS

### *Offset calibration status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log reports the status and estimated values of the currently running offset calibration.

**Message ID:** 1961

**Log Type:** Asynch

**Abbreviated ASCII Syntax:**

```
log inscalstatus onchanged
```

**ASCII Example:**

```
#INSCALSTATUSA,COM1,0,80.0,FINESTEERING,1880,317815.012,02000000,a4f2,32768;RBV,0.0000,-180.0000,-90.0000,45.0000,45.0000,45.0000,INS_CONVERGING,1*e0b3152d
```

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
1	INSCALSTATUS header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Offset Type	Type of offset (see <i>Table 229: Offset Type</i> on the next page).	Enum	4	H
3	X axis offset	IMU body frame X-axis offset (m/degrees).	Float	4	H+4
4	Y axis offset	IMU body frame Y-axis offset (m/degrees).	Float	4	H+8
5	Z axis offset	IMU body frame Z-axis offset (m/degrees).	Float	4	H+12
6	X uncertainty	IMU body frame X-axis offset uncertainty (m/degrees).	Float	4	H+16
7	Y uncertainty	IMU body frame Y-axis offset uncertainty (m/degrees).	Float	4	H+20
8	Z uncertainty	IMU body frame Z-axis offset uncertainty (m/degrees).	Float	4	H+24
9	Source Status	Source from which offset values originate (see <i>Table 230: Source Status</i> on the next page).	Enum	4	H+28
10	Multi-line Calibration Count	Counter for number of completed calibrations cumulatively averaged.	Ulong	4	H+32
11	xxxx	32-bit CRC (ASCII and Binary only).	Hex	4	H+36
12	[CR][LF]	Sentence terminator (ASCII only).	-	-	-

Units for the axis offset and uncertainty values (fields 3-8) are in meters for translational offset components and degrees for rotational offset components.

**Table 229: Offset Type**

Binary	ASCII	Description
1	ANT1	Primary IMU to antenna lever arm
8	ALIGN	Align offset
11	RBV	IMU body to vehicle offset

**Table 230: Source Status**

Binary	ASCII	Description
1	FROM_NVM	Offset values originate from saved parameters in NVM
2	CALIBRATING	Offset values originate from a currently running calibration process
3	CALIBRATED	Offset values originate from a completed calibration process
4	FROM_COMMAND	Offset values originate from a user command
5	Reserved	
6	FROM_DUAL_ANT	Offset values originate from a dual antenna Align solution
7	INS_CONVERGING	Offset values originate from initial input values. Calibration process on hold until INS solution is converged.
8	INSUFFICIENT_SPEED	Offset values originate from a currently running calibration process. Further estimation on hold due to insufficient speed.
9	HIGH_ROTATION	Offset values originate from a currently running calibration process. Further estimation on hold due to high vehicle rotations.

## 5.18 INSCONFIG

### *Determine required settings for post-processing or system analysis*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the single message required to determine all required settings for post-processing or system analysis. This log is asynchronous and published for any change to the included fields. It is intended to be recorded occasionally though it could be updated frequently at system startup. The **INSCONFIG** log may also be logged synchronously with the ONTIME trigger, but this log should **NOT** be requested at a high rate (limited to 1 Hz).

**Message ID:** 1945

**Log Type:** Asynch

**Recommended Input:**

```
log insconfig onchanged
```

**ASCII Example:**

```
#INSCONFIGA,COM1,0,71.0,COARSESTEERING,1931,517331.006,02400000,6d7a,32768;

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
1	INSCONFIG Header	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	IMU Type	IMU type. See <i>Table 218: IMU Type</i> on page 890.	Enum	4	H
3	Mapping	Mapping / Orientation	Uchar	1	H+4
4	Initial Alignment Velocity	Minimum Alignment Velocity entered by the user (see the <b>SETALIGNMENTVEL</b> command on page 911). <b>Note:</b> Velocity (m/s) is scaled by 10 for 10 cm/s precision	Uchar	1	H+5
5	Heave Window	Length of the heave window in seconds (if set using the <b>SETHEAWEWINDOW</b> command on page 912)	Ushort	2	H+6
6	Profile	Profile setting (see the <b>SETINSPROFILE</b> command on page 918)	Enum	4	H+8
7	INS Enabled Updates	Enabled INS updates (see <i>Table 235: INS Update Values</i> on page 993)	Hex	4	H+12
8	Alignment Mode	Alignment mode configured on the system (see the <b>ALIGNMENTMODE</b> command on page 887)	Enum	4	H+16

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
9	Relative INS Output Frame	The user specified output frame of the Relative INS Vector (see <b>SETRELINSOUTPUTFRAME</b> command on page 927) If not specified, the default value appears.	Enum	4	H+20
10	Relative INS Output Direction	The User specified Output direction of the Relative INS Vector (From or To Master-Rover) (see the <b>SETRELINSOUTPUTFRAME</b> command on page 927). If not specified, the default value appears. TRUE if From Master, FALSE (Default) if From Rover	Bool	4	H+24
11	INS Receiver Status	Lower byte- INS Reset. Corresponds numerically to the INS Reset as described by the INSResetEnum Second byte- = 0x01 if an IMU Communication Error (Receiver status bit 17). = 0x00 otherwise. Other values are reserved for future use. Upper 2 bytes - reserved.	Hex	4	H+28
12	INS Seed Enabled	INS Seed Enable setting (see the <b>INSSEED</b> command on page 903) Enabled = 1, Disabled = 0	Uchar	1	H+32
13	INS Seed Validation	INS Seed Validation setting (see the <b>INSSEED</b> command on page 903)	Uchar	1	H+33
14	Reserved 1		N/A	2	H+34
15	Reserved 2		N/A	4	H+36
16	Reserved 3		N/A	4	H+40
17	Reserved 4		N/A	4	H+44
18	Reserved 5		N/A	4	H+48
19	Reserved 6		N/A	4	H+52
20	Reserved 7		N/A	4	H+56
21	Number of Translations	Number of translation entries to follow	Ulong	4	H+60
22	Translation	Translation to follow (see <i>Table 223: Translation Offset Types</i> on page 923)	Enum	4	variable
23	Frame	Frame of translation (IMUBODY or VEHICLE)	Enum	4	variable
24	X Offset	X Offset	Float	4	variable

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
25	Y Offset	Y Offset	Float	4	variable
26	Z Offset	Z Offset	Float	4	variable
27	X Uncertainty	X Uncertainty	Float	4	variable
28	Y Uncertainty	Y Uncertainty	Float	4	variable
29	Z Uncertainty	Z Uncertainty	Float	4	variable
30	Translation Source	Source of translation (see <i>Table 230: Source Status</i> on page 964)	Enum	4	variable
Next Translation					
variable	Number of Rotations	Number of rotation entries to follow	Ulong	4	variable
variable	Rotation	Rotation to follow (see <i>Table 222: Rotational Offset Types</i> on page 920)	Enum	4	variable
variable	Frame	Frame of rotation (IMUBODY or VEHICLE)	Enum	4	variable
variable	X Rotation	X Rotation	Float	4	variable
variable	Y Rotation	Y Rotation	Float	4	variable
variable	Z Rotation	Z Rotation	Float	4	variable
variable	X Rotation Std Dev	X Rotation offset standard deviation (degrees)	Float	4	variable
variable	Y Rotation STD Dev	Y Rotation offset standard deviation (degrees)	Float	4	variable
variable	Z Rotation STD Dev	Z Rotation offset standard deviation (degrees)	Float	4	variable
variable	Rotation Source	Source of rotation (see <i>Table 230: Source Status</i> on page 964)	Enum	4	variable
Next Rotation					
variable	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.19 INSDATUMINFO

### *Datum information for INS position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log reports the datum and co-ordinate epoch of the solution for all INS logs with position output (**INSPVA**, **INSPVAX**, **INSPVACMP**, **INSPOS**, **INSPOSX**, **MARKxPVA** and **TAGGEDMARKxPVA**).

**Message ID:** 2384

**Log Type:** Asynch

**Recommended Input:**

```
log insdatuminfoa onchanged
```

**ASCII Example:**

```
#INSDATUMINFOA,USB3,0,65.0,FINESTEERING,2110,153300.000,020000a0,f6f5,32768;
"NAD83 (CSRS) ",6140,2018.000,GOOD,0.000000000,0*fef68917
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSDATUMINFO header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	datum	Datum of the position being output by the INS position logs.	Char [32]	variable	H
3	epsg_code	EPSG code of the datum.	Ulong	4	variable
4	epoch	Co-ordinate epoch (decimal year). Example: 2011.00 = Jan 1, 2011 2011.19 = Mar 11, 2011	Double	8	variable
5	status	Transformation status. See <i>Table 79: Transformation Status</i> on page 426.	Enum	4	variable
6	reserved	Reserved for future use	Float	4	variable
7	reserved	Reserved for future use	Ulong	4	variable
8	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	variable
9	[CR][LF]	Sentence terminator (ASCII only)	–	–	–

## 5.20 INSPOS

### *INS Position*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the most recent position measurements in WGS84 coordinates and includes an INS status indicator. The log reports the position at the IMU center, unless the **SETINSTRANSLATION USER** command was issued. See the **SETINSTRANSLATION** command on page 922.

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 265

**Log Type:** Synch

**Recommended Input:**

```
log insposa ontime 1
```

**ASCII Example:**

```
#INSPOSA,USB2,0,18.0,FINESTEERING,1541,487977.000,02040000,17cd,37343;1541,
487977.000549050,51.121315135,-114.042311349,1038.660737046,INS_SOLUTION_GOOD
*2ffffd557
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSPOS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Latitude	Latitude [degrees]	Double	8	H+12
5	Longitude	Longitude[degrees]	Double	8	H+20
6	Height	Ellipsoidal Height [m]	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.21 INSPOSS

### Short INS Position

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSPOS** log (see page 969).

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 321

**Log Type:** Synch

**Recommended Input:**

```
log inspossa ontime 1
```

**ASCII Example:**

```
%INSPOSSA,1541,487916.000;1541,487916.000549050,51.115797277,-114.037811065,1039.030700122,INS_SOLUTION_GOOD*5ca30894
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSPOSS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Latitude	Latitude [degrees]	Double	8	H+12
5	Longitude	Longitude [degrees]	Double	8	H+20
6	Height	Ellipsoidal Height [m]	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.22 INSPOX

### *Inertial Position – Extended*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log includes the information from the INSPOS log, as well as information about the position standard deviation. The position type and solution status fields indicate whether or not the corresponding data is valid.

The INSPOX log is a large log and is not recommend for high rate logging.

If you want to use high rate logging, log the **INSPOSS** log at a high rate and the **INSSTDEVS** log ontime 1.

This log provides the position information in the user datum.

To determine the datum being used, log the **BESTPOS** log.

**Message ID:** 1459

**Log Type:** Synch

**Recommended Input:**

```
log insposxa ontime 1
```

**ASCII example:**

```
#INSPOXA,COM4,0,46.0,FINESTEERING,2088,169976.000,02004020,1e1d,15823;  
INS_SOLUTION_GOOD,INS_PSRSP,51.15036800018,-114.03064199432,1097.3581,  
-17.0000,5.2758,5.1921,5.9453,13000044,0*1aaf8eac
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSPOX Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	INS Status	Solution status See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H
3	Pos Type	Position type See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	Lat	Latitude	Double	8	H+8
5	Long	Longitude	Double	8	H+16
6	Height	Height above sea level (m)	Double	8	H+24
7	Undulation	Undulation (m)	Float	4	H+32

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
8	Lat $\sigma$	Latitude standard deviation	Float	4	H+36
9	Long $\sigma$	Longitude standard deviation	Float	4	H+34
10	Height $\sigma$	Height standard deviation	Float	4	H+44
11	Ext sol stat	Extended solution status See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+48
11	Time Since Update	Elapsed time since the last ZUPT or position update (seconds)	Ushort	2	H+52
12	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+54
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

The INS covariance and standard deviation values reported by the SPAN filter are an estimate of the Inertial filter solution quality. In lower accuracy GNSS position modes, such as SINGLE or WAAS (see *Table 81: Position or Velocity Type* on page 433), the position covariance and standard deviation values can appear to become optimistic compared with the absolute GNSS accuracy. This is due to the INS filter's ability to smooth short term noise in the GNSS solution, although the overall position error envelope still reflects the GNSS accuracy. Therefore, if the desired application requires absolute GNSS position accuracy, it is recommended to also monitor GNSS position messages such as BESTGNSSPOS (see **BESTGNSSPOS** log on page 934).

## 5.23 INSPVA

### *INS Position, Velocity and Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log allows INS position, velocity and attitude, with respect to the SPAN frame, to be collected in one log, instead of using three separate logs. Refer to the **INSATT** log (see page 954) for an explanation of how the SPAN frame may differ from the IMU enclosure frame.

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 507

**Log Type:** Synch

**Recommended Input:**

```
log inspvaa ontime 1
```

**ASCII Example:**

```
#INSPVAA, COM1, 0, 31.0, FINESTEERING, 1264, 144088.000, 02040000, 5615, 1541; 1264,
144088.002284950, 51.116827527, -114.037738908, 401.191547167, 354.846489850,
108.429407241, -10.837482850, 1.116219952, -3.476059035, 7.372686190,
INS_ALIGNMENT_COMPLETE*af719fd9
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSPVA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds	Seconds from week start	Double	8	H+4
4	Latitude	Latitude [degrees]	Double	8	H+12
5	Longitude	Longitude [degrees]	Double	8	H+20
6	Height	Ellipsoidal Height [m]	Double	8	H+28
7	North Velocity	Velocity in a northerly direction (a -ve value implies a southerly direction) [m/s]	Double	8	H+36
8	East Velocity	Velocity in an easterly direction (a -ve value implies a westerly direction) [m/s]	Double	8	H+44
9	Up Velocity	Velocity in an up direction [m/s]	Double	8	H+52
10	Roll	Right-handed rotation from local level around y-axis in degrees	Double	8	H+60

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
11	Pitch	Right-handed rotation from local level around x-axis in degrees	Double	8	H+68
12	Azimuth	Left-handed rotation around z-axis in degrees clockwise from North This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+76
13	Status	INS Status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+84
14	xxxx	32-bit CRC	Hex	4	H+88
15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.24 INSPVACMP

### *Compressed version of the INSPVA log for CAN*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the **INSPVA** log (see page 973) information compressed as a NMEA 2000 fast packet message for CAN output. The PGN of this message is configured using the **PGNCONFIG** command on page 251. The information in the table below is the data portion of the INSPVACMP NMEA 2000 message. Refer to the *NATIONAL MARINE ELECTRONICS ASSOCIATION (NMEA) NMEA2000(r) rev 2.0 - January/2013* document for full details on this message output and the NMEA 2000 fast packet protocol.

**Message ID: 1889**

**Log Type: Synch**

**Abbreviated ASCII Syntax:**

```
LOG CCOM1 INSPVACMP ONTIME 1
```

Field	Field Type	Description	Format	Binary Bytes	Units	Scale Factor
1	Message Time	Seconds from week start	Ulong	4	seconds	0.001
2	INS Status	INS solution status (see <i>Table 225: Inertial Solution Status</i> on page 955)	UChar	1	N/A	N/A
3	GNSS Position Type	GNSS position type (see <i>Table 81: Position or Velocity Type</i> on page 433)	UChar	1	N/A	N/A
4	Latitude	Latitude (WGS84)	5 byte Long	5	degrees	180/2 39
5	Longitude	Longitude (WGS84)	5 byte Long	5	degrees	180/2 39
6	Height	Ellipsoidal Height (WGS84)	Long	4	meters	0.0001
7	North Velocity	Velocity in a northerly direction (a -ve value implies a southerly direction)	Short	2	m/s	0.002
8	East Velocity	Velocity in an easterly direction (a -ve value implies a westerly direction)	Short	2	m/s	0.002
9	Up Velocity	Velocity in an up direction	Short	2	m/s	0.002
10	Roll	Right-handed rotation from local level around y axis	Short	2	degrees	0.01
11	Pitch	Right-handed rotation from local level around x axis	Short	2	degrees	0.01

Field	Field Type	Description	Format	Binary Bytes	Units	Scale Factor
12	Azimuth	Left-handed rotation around z-axis clockwise from North This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Ushort	2	degrees	0.01
13	Azimuth Rate	Rate of change of the Azimuth	Short	2	degrees/s	0.01

## 5.25 INSPVAS

### *Short INS Position, Velocity and Attitude*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSPVA** log (see page 973).

This log provides the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 508

**Log Type:** Synch

**Recommended Input:**

```
log inspvasa ontime 1
```

**ASCII Example:**

```
%INSPVASA,1264,144059.000;1264,144059.002135700,51.116680071,-114.037929194,515.286704183,277.896368884,84.915188605,-8.488207941,0.759619515,-2.892414901,6.179554750,INS_ALIGNMENT_COMPLETE*855d6f76
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSPVAS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds	Seconds from week start	Double	8	H+4
4	Latitude	Latitude [degrees]	Double	8	H+12
5	Longitude	Longitude [degrees]	Double	8	H+20
6	Height	Ellipsoidal Height [m]	Double	8	H+28
7	North Velocity	Velocity in a northerly direction (a -ve value implies a southerly direction) [m/s]	Double	8	H+36
8	East Velocity	Velocity in an easterly direction (a -ve value implies a westerly direction) [m/s]	Double	8	H+44
9	Up Velocity	Velocity in an up direction [m/s]	Double	8	H+52
10	Roll	Right-handed rotation from local level around y-axis in degrees	Double	8	H+60
11	Pitch	Right-handed rotation from local level around x-axis in degrees	Double	8	H+68

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
12	Azimuth	Left-handed rotation around z-axis in degrees clockwise from north This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+76
13	Status	INS Status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+84
14	xxxx	32-bit CRC	Hex	4	H+88
15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.26 INSPVASDCMP

### *Standard deviation information for the INSPVACMP CAN message*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the standard deviation information for the **INSPVACMP** log (see page 975) information compressed in a NMEA 2000 fast packet message for CAN output. The PGN of this message is configured using the **PGNCONFIG** command on page 251. The information in the table below is the data portion of the INSPVASDCMP NMEA 2000 message. Refer to the *NATIONAL MARINE ELECTRONICS ASSOCIATION (NMEA) NMEA2000(r) rev 2.0 - January/2013* document for full details on this message output and the NMEA 2000 fast packet protocol.

**Message ID:** 1890

**LogType:** Synch

**Abbreviated ASCII Syntax:**

```
LOG CCOM1 INSPVASDCMP ONTIME 1
```

Field	Field Type	Description	Format	Binary Bytes	Units	Scale Format
1	Week	GNSS Week	Ushort	2	weeks	1
2	Message Time	Seconds from week start	Ulong	4	seconds	0.001
3	Sigma Latitude	Latitude Standard Deviation	Ushort	2	meters	0.001
4	Sigma Longitude	Longitude Standard Deviation	Ushort	2	meters	0.001
5	Sigma Height	Height Standard Deviation	Ushort	2	meters	0.001
6	Sigma North Velocity	North Velocity Standard Deviation	Ushort	2	m/s	0.001
7	Sigma East Velocity	East Velocity Standard Deviation	Ushort	2	m/s	0.001
8	Sigma Up Velocity	Up Velocity Standard Deviation	Ushort	2	m/s	0.001
9	Sigma Roll	Roll Standard Deviation	Ushort	2	degrees	0.01
10	Sigma Pitch	Pitch Standard Deviation	Ushort	2	degrees	0.01
11	Sigma Azimuth	Azimuth Standard Deviation	Ushort	2	degrees	0.01
12	Update Counter	Elapsed time since the last ZUPT or position update	Uchar	1	seconds	1

Field	Field Type	Description	Format	Binary Bytes	Units	Scale Format
13	Position Type	GNSS position type (see <i>Table 81: Position or Velocity Type</i> on page 433)	Uchar	1	N/A	N/A
14	Extended Solution Status	Extended Solution Status (see <i>Table 226: Extended Solution Status</i> on page 960)	Hex	4	N/A	N/A
15	ALIGN Age	Elapsed time since a valid ROVERPOS solution was available	Uchar	1	seconds	1

## 5.27 INSPVAX

### *Inertial PVA – Extended*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log includes the information from the INSPVA log, as well as information about the position standard deviation. The position type and solution status fields indicate whether or not the corresponding data is valid.

The INSPVAX log is a large log and is not recommend for high rate logging.

If you want to use high rate logging, log the **INSPVAS** log (see page 977) at a high rate and the **INSSTDEV** log on page 987 ontime 1.

This log provides the position information in the user datum.

To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:** 1465

**Log Type:** Synch

**Recommended Input:**

```
log inspvaxa ontime 1
```

**ASCII example:**

```
#INSPVAXA,COM4,0,48.0,FINESTEERING,2088,169979.000,02004020,471d,15823;

0.0007,-0.0027,0.0006,-0.056479668,0.504066737,90.285883014,5.2756,5.1919,  
5.9401,0.0014,0.0014,0.0011,0.5442,0.5345,0.0833,13000044,0*2813a8d7
```

Field	Field Type	Data Description	Format	Binary Bytes	Binary Offset
1	INSPVAX Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	INS Status	Solution status See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H
3	Pos Type	Position type See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	Lat	Latitude (degrees)	Double	8	H+8
5	Long	Longitude (degrees)	Double	8	H+16
6	Height	Height above mean sea level (m)	Double	8	H+24
7	Undulation	Undulation (m)	Float	4	H+32
8	North Vel	North velocity (m/s)	Double	8	H+36

Field	Field Type	Data Description	Format	Binary Bytes	Binary Offset
9	East Vel	East velocity (m/s)	Double	8	H+44
10	Up Vel	Up velocity (m/s)	Double	8	H+52
11	Roll	Roll in Local Level (degrees)	Double	8	H+60
12	Pitch	Pitch in Local Level (degrees)	Double	8	H+68
13	Azimuth	Azimuth in Local Level (degrees) This is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	Double	8	H+76
14	Lat $\sigma$	Latitude standard deviation (m)	Float	4	H+84
15	Long $\sigma$	Longitude standard deviation (m)	Float	4	H+88
16	Height $\sigma$	Height standard deviation (m)	Float	4	H+92
17	North Vel $\sigma$	North velocity standard deviation (m/s)	Float	4	H+96
18	East Vel $\sigma$	East velocity standard deviation (m/s)	Float	4	H+100
19	Up Vel $\sigma$	Up velocity standard deviation (m/s)	Float	4	H+104
20	Roll $\sigma$	Roll standard deviation (degrees)	Float	4	H+108
21	Pitch $\sigma$	Pitch standard deviation (degrees)	Float	4	H+112
22	Azimuth $\sigma$	Azimuth standard deviation (degrees)	Float	4	H+116
23	Ext sol stat	Extended solution status See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+120
24	Time Since Update	Elapsed time since the last ZUPT or position update (seconds)	Ushort	2	H+124
25	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+126
26	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

The INS covariance and standard deviation values reported by the SPAN filter are an estimate of the Inertial filter solution quality. In lower accuracy GNSS position modes, such as SINGLE or WAAS (see *Table 81: Position or Velocity Type* on page 433), the position covariance and standard deviation values can appear to become optimistic compared with the absolute GNSS accuracy. This is due to the INS filter's ability to smooth short term noise in the GNSS solution, although the overall position error envelope still reflects the GNSS accuracy. Therefore, if the desired application requires absolute GNSS position accuracy, it is recommended to also monitor GNSS position messages such as BESTGNSSPOS (see **BESTGNSSPOS** log on page 934).

## 5.28 INSSEEDSTATUS

### *Status of INS Seed*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log reports the current status of the INS Seed. See the [OEM7 SPAN Installation and Operation User Manual](#) for more information about an INS Seed.

**Message ID:** 2129

**Log Type:** Asynch

**Abbreviated ASCII Syntax:**

```
log insseedstatusa onnew
```

**Example:**

```
#INSSEEDSTATUSA,COM3,0,66.0,FINESTEERING,1945,315811.009,02040020,9fd0,32768;
INJECTED,ALLVALID,-0.098151498,0.298816800,95.888587952,
-1634544.0523482216522098,-3664556.8064546003006399,
4942534.6315599447116256,-16.9000,0,0,0,0*f353470c
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSSEEDSTATUS header	Command header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Injection Status	Status of the INS Seed being injected into the solution. See <i>Table 231: Injection Status</i> on the next page	Enum	4	H
3	Validity Status	Flag to indicate if current seed data in NVM is valid. See <i>Table 232: Validity Status</i> on the next page	Bool	4	H+4
4	Pitch	IMU frame pitch angle (degrees)	Float	4	H+8
5	Roll	IMU frame roll angle (degrees)	Float	4	H+12
6	Azimuth	IMU frame azimuth angle (degrees)	Float	4	H+16
7	PositionX	ECEF-based x-coordinate	Double	8	H+20
8	PositionY	ECEF-based y-coordinate	Double	8	H+28
9	PositionZ	ECEF-based z-coordinate	Double	8	H+36
10	Undulation	Geoid undulation	Float	4	H+44
11	Reserved		Ulong	4	H+48
12	Reserved		Ulong	4	H+52
13	Reserved		Ulong	4	H+56
14	Reserved		Ulong	4	H+60

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
15	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+64
16	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

**Table 231: Injection Status**

Binary	ASCII	Description
0	NOT_INITIALIZED	INS Seed has not been injected into the solution
1	INVALID	Valid INS Seed was not found in non-volatile memory
2	FAILED	INS Seed has failed validation and has been discarded
3	PENDING	INS Seed is awaiting validation
4	INJECTED	INS Seed alignment data has successfully been injected (including error model data)
5	IGNORED	INS Seed was pending, but has been ignored due to a user commanded filter reset or configuration change
6	ERRORMODELINJECTED	INS Seed error model data has successfully been injected

**Table 232: Validity Status**

Binary	ASCII	Description
0	INVALID	INS Seed in NVM is not valid
1	ALLVALID	INS Seed in NVM is valid
2	ERRORMODELVALID	INS Seed error model in NVM is valid (alignment data is not valid)

## 5.29 INSSPD

### *INS Speed*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the most recent speed measurements in the horizontal and vertical directions and includes an INS status indicator.

**Message ID:** 266

**Log Type:** Synch

**Recommended Input:**

```
log insspda ontime 1
```

**ASCII Example:**

```
#INSSPDA,USB2,0,20.0,FINESTEERING,1541,487969.000,02040000,7832,37343;1541,4879
69.000549050,329.621116190,14.182070674,-0.126606551,INS_SOLUTION_GOOD
*c274fff2
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSSPD Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees  The track over ground is determined by comparing the current position determined from the GNSS/INS solution with the previously determined position.  Track over ground is best used when the vehicle is moving. When the vehicle is stationary, position error can make the direction of motion appear to change randomly.	Double	8	H+12
5	Horizontal Speed	Magnitude of horizontal speed in m/s.	Double	8	H+20
6	Vertical Speed	Magnitude of vertical speed in m/s where a positive value indicates speed upward and a negative value indicates speed downward.	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.30 INSSPDS

### Short INS Speed

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSSPD** log (see page 985).

**Message ID:** 323

**Log Type:** Synch

**Recommended Input:**

```
log insspdsa ontime 1
```

**ASCII Example:**

```
%INSSPDSA,1541,487975.000;1541,487975.000549050,323.101450813,9.787233999,-
0.038980077,INS_SOLUTION_GOOD*105ba028
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSSPDS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	Trk gnd	Actual direction of motion over ground (track over ground) with respect to True North, in degrees.  The track over ground is determined by comparing the current position determined from the GNSS/INS solution with the previously determined position.  Track over ground is best used when the vehicle is moving. When the vehicle is stationary, position error can make the direction of motion appear to change randomly.	Double	8	H+12
5	Horizontal Speed	Magnitude of horizontal speed in m/s.	Double	8	H+20
6	Vertical Speed	Magnitude of vertical speed in m/s where a positive value indicates speed upward and a negative value indicates speed downward.	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.31 INSSTDEV

### *INS PVA standard deviations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log displays the INS PVA standard deviations.

**Message ID:** 2051

**Log Type:** Synch

**Abbreviated ASCII Syntax:**

```
log insstdev ontime 1
```

**ASCII Example:**

```
#INSSTDEVA,COM1,0,78.0,FINESTEERING,1907,233990.000,02000020,3e6d,32768;0.4372,
0.3139,0.7547,0.0015,0.0015,0.0014,3.7503,3.7534,5.1857,26000005,0,0,01ffd1bf,0
*3deca7d2
```

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
1	INSSTDEV Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Latitude $\sigma$	Latitude standard deviation (m)	Float	4	H
3	Longitude $\sigma$	Longitude standard deviation (m)	Float	4	H+4
4	Height $\sigma$	Height standard deviation (m)	Float	4	H+8
5	North Velocity $\sigma$	North velocity standard deviation (m/s)	Float	4	H+12
6	East Velocity $\sigma$	East velocity standard deviation (m/s)	Float	4	H+16
7	Up Velocity $\sigma$	Up velocity standard deviation (m/s)	Float	4	H+20
8	Roll $\sigma$	Roll standard deviation (degrees)	Float	4	H+24
9	Pitch $\sigma$	Pitch standard deviation (degrees)	Float	4	H+28
10	Azimuth $\sigma$	Azimuth standard deviation (degrees)	Float	4	H+32
11	Ext sol stat	Extended solution status See <i>Table 226: Extended Solution Status</i> on page 960	Ulong	4	H+36
12	Time Since Update	Elapsed time since the last ZUPT or position update (seconds)	Ushort	2	H+40
13	Reserved		Ushort	2	H+42

Field	Field Type	Description	Binary Format	Binary Bytes	Binary Offset
14	Reserved		Ulong	4	H+44
15	Reserved		Ulong	4	H+48
16	xxxx	32-bit CRC (ASCII and Binary only).	Hex	4	H+52
17	[CR][LF]	Sentence terminator (ASCII only).	-	-	-

## 5.32 INSSTDEVS

### *Short INS PVA standard deviations*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSSTDEV** log (see page 987).

**Message ID:** 2052

**Log Type:** Synch

**Abbreviated ASCII Syntax:**

```
log insstdevs ontime 1
```

**ASCII Example:**

```
%INSSTDEVSA,1907,233990.000;0.4372,0.3139,0.7547,0.0015,0.0015,0.0014,3.7503,3.7534,5.1857,26000005,0,0,01ffd1bf,0*2c967ced
```

17	[CR][LF]	Sentence terminator (ASCII only).	-	-	-

## 5.33 INSUPDATESTATUS

### *INS Update Status*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the most recent INS update information used by the system. It provides information about what updates were performed in the INS filter at the specified time.

Multiple **INSUPDATESTATUS** logs may be published each epoch. For example, any DMI or external updates will trigger an independent, asynchronous log. These asynchronous logs may show that other updates are not being used because they are the only valid update applied at the specified time.

In the ASCII example below, the first INSUPDATESTATUS log shows X updates were applied at 416218.000 and the second INSUPDATESTATUS log shows the DMI update was USED at 416218.002.

**Message ID:** 1825

**Log Type:** Asynch

**Recommended Input:**

```
log insupdatestatus onchanged
```

**ASCII Example:**

```
#INSUPDATESTATUSA,COM3,0,49.0,FINESTEERING,2117,416218.000,02004020,78f1,32768;
INS_PSRSP,0,22,24,INACTIVE,USED,0b0020c3,007ff3bf,0,0*c1d6e8bc

#INSUPDATESTATUSA,COM3,0,49.0,FINESTEERING,2117,416218.002,02004020,78f1,32768;
INS_PSRSP,0,0,0,USED,INACTIVE,0b0020c3,007ff3bf,0,0*0aa584c7
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSUPDATE STATUS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	PosType	Type of GNSS solution used for the last INS filter update. See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H
3	NumPSR	Number of raw pseudorange observations used in the last INS filter update.	Integer	4	H+4
4	NumADR	Number of raw phase observations used in the last INS filter update.	Integer	4	H+8
5	NumDOP	Number of raw doppler observations used in the last INS filter update.	Integer	4	H+12
6	DMI Update Status	Distance measurement instrument (wheel sensor) status. See <i>Table 233: DMI Update Status</i> on the next page.	Enum	4	H+16

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
7	Heading Update Status	Status of the heading update during the last INS filter update. See <i>Table 234: Heading Update Values</i> below	Enum	4	H+20
8	Ext sol stat	Extended solution status See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+24
9	INS Enabled Updates	Enabled INS updates. See <i>Table 235: INS Update Values</i> on the next page	Hex	4	H+28
10	Reserved		Ulong	4	H+32
11	Reserved		Ulong	4	H+36
12	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
13	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

**Table 233: DMI Update Status**

Binary	ASCII	Description
0	INACTIVE	The DMI sensor is not connected.
1	ACTIVE	The DMI sensor is connected but not used.
2	USED	The DMI sensor is connected and used in the INS solution.
3	RESERVED	Reserved
4	BAD_MISC	The measurement of the DMI sensor resulted in bad misclosure and was rejected.
5	HIGH_ROTATION	The measurement of the DMI sensor was not used because the system is undergoing high rotation.
6	DISABLED	DMI updates are disabled.
7	ZUPT	The DMI update reported zero velocity.

**Table 234: Heading Update Values**

Binary	ASCII	Description
0	INACTIVE	A heading update was not available.
1	ACTIVE	Heading updates are running, but the epoch is not used as an update. When all other rejection criteria pass, a heading update will still only be applied once every 5 seconds (20 seconds when stationary).
2	USED	The update for that epoch was taken.
5	HEADING_UPDATE_BAD_MISC	Heading updates are running, but was not performed this epoch due to a large disagreement with filter estimates.

Table 235: INS Update Values

Nibble	Bit	Mask	Description	Range Value
N0	0	0x00000001	Position update	0 = Disabled 1 = Enabled
	1	0x00000002	Phase update	0 = Disabled 1 = Enabled
	2	0x00000004	Zero velocity update	0 = Disabled 1 = Enabled
	3	0x00000008	Wheel sensor update	0 = Disabled 1 = Enabled
N1	4	0x00000010	ALIGN (heading) update	0 = Disabled 1 = Enabled
	5	0x00000020	External position update	0 = Disabled 1 = Enabled
	6	0x00000040	Reserved	
	7	0x00000080	Doppler update	0 = Disabled 1 = Enabled
N2	8	0x00000100	Pseudorange update	0 = Disabled 1 = Enabled
	9	0x00000200	Velocity update	0 = Disabled 1 = Enabled
	10	0x00000400	Reserved	
	11	0x00000800	Dead reckoning update	0 = Disabled 1 = Enabled
N3	12	0x00001000	Phase wind up update	0 = Disabled 1 = Enabled
	13	0x00002000	Course over ground update	0 = Disabled 1 = Enabled
	14	0x00004000	External velocity update	0 = Disabled 1 = Enabled
	15	0x00008000	External attitude update	0 = Disabled 1 = Enabled

---

Nibble	Bit	Mask	Description	Range Value
N4	16	0x00010000	External heading update	0 = Disabled 1 = Enabled
	17	0x00020000	External height update	0 = Disabled 1 = Enabled
	18	0x00040000	Reserved	
	19	0x00080000	Reserved	

## 5.34 INSVEL

### *INS Velocity*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains the most recent North, East and Up velocity vector values, with respect to the local level frame and also includes an INS status indicator.

**Message ID:** 267

**Log Type:** Synch

**Recommended Input:**

```
log insvela ontime 1
```

**ASCII Example:**

```
#INSVELA,USB1,0,19.0,FINESTEERING,1543,236173.000,02000000,9c95,37343;1543,236173.002500000,14.139471871,-0.070354464,-0.044204369,INS_SOLUTION_GOOD*3c37c0fc
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSVEL Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	North Velocity	Velocity North in m/s	Double	8	H+12
5	East Velocity	Velocity East in m/s	Double	8	H+20
6	Up Velocity	Velocity Up in m/s	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.35 INSVELS

### Short INS Velocity

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **INSVEL** log (see page 995).

**Message ID:** 324

**Log Type:** Synch

**Recommended Input:**

```
log insvelsa ontime 1
```

**ASCII Example:**

```
%INSVELSA,1921,152855.200;1921,152855.200000000,0.1077,-9.8326,-0.1504,INS_
SOLUTION_GOOD*efd71f65
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSVELS Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week	Ulong	4	H
3	Seconds into Week	Seconds from week start	Double	8	H+4
4	North Velocity	Velocity North m/s	Double	8	H+12
5	East Velocity	Velocity East m/s	Double	8	H+20
6	Up Velocity	Velocity Up m/s	Double	8	H+28
7	Status	INS status, see <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+36
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+40
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.36 INSVELUSER

### *INS velocity in user output frame*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7, SMART2

This log outputs INS Velocity information in the user defined output frame as per the **SETINSROTATION USER** command. The default, when no USER rotation is defined, is the vehicle frame assuming a valid RBV rotation has been entered.

The velocity information will be translated to the reference point defined by the **SETINSTRANSULATION USER** command.

The *Slip Angle Validity* flag provides an indication of the confidence in the slip angle calculation based on the solution quality. Included in the quality indicators for a valid slip angle is a check for minimum vehicle speed. The user should consider the velocity standard deviations when using both the velocity and slip angle values.

The range of the Slip Angle is -180 to 180 degrees. When the Slip Angle is positive, the vehicle is slipping to the driver's right (starboard) assuming the user frame Y axis coincides with the vehicle forward direction of travel. When the Slip Angle is negative, the vehicle is slipping to the driver's left (port). This corresponds to the sign of the velocity in the user frame X axis.

**Message ID:** 2318

**Log Type:** Synch

**Recommended Input:**

```
LOG INSVELUSER ONTIME 1
```

**Abbreviated ASCII Example:**

```
#INSVELUSERA, COM1, 0, 56.0, FINESTEERING, 2122, 395201.000, 02004000, 9ac8, 32768;
INS_ALIGNMENT_COMPLETE, -0.0064, -0.0007, -0.0115, 0.0557, 0.0452, 0.0884, -96.492,
0, 0, 00000000*1faadf5b
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSVELUSER Header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	INS Status	Solution status See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H

## 5.37 INSVELX

### *Inertial Velocity – Extended*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log includes the information from the INSVEL log, as well as information about the velocity standard deviation. The position type and solution status fields indicate whether or not the corresponding data is valid.

The INSVELX log is a large log and is not recommend for high rate logging.

If you want to use high rate logging, log the **INSVELS** log at a high rate and the **INSSTDEVS** log ontime 1.

**Message ID:** 1458

**Log Type:** Synch

**Recommended Input:**

```
log insvelxa ontime 1
```

**ASCII example:**

```
#INSVELXA,COM4,0,46.5,FINESTEERING,2088,169982.000,02004020,1a1f,15823;  
INS_SOLUTION_GOOD,INS_PSRSP,0.0003,0.0002,-0.0009,0.0014,0.0014,0.0011,  
13000044,0*3f7881dc
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	INSVELX Header	Log header. See <i>Messages</i> on page 30 for more information.		H	0
2	INS Status	Solution status See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H
3	Pos Type	Position type See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+4
4	North Vel	North velocity (m/s)	Double	8	H+8
5	East Vel	East velocity (m/s)	Double	8	H+16
6	Up Vel	Up velocity (m/s)	Double	8	H+24
7	North Vel $\sigma$	North velocity standard deviation (m/s)	Float	4	H+32
8	East Vel $\sigma$	East velocity standard deviation (m/s)	Float	4	H+36
9	Up Vel $\sigma$	Up velocity standard deviation (m/s)	Float	4	H+40

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
10	Ext sol stat	Extended solution status See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+44
11	Time Since Update	Elapsed time since the last ZUPT or position update (seconds)	Ushort	2	H+48
11	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+50
12	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.38 MARK1PVA, MARK2PVA, MARK3PVA and MARK4PVA

### *Position, Velocity and Attitude at Mark Input Event*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

These logs output position, velocity and attitude information, with respect to the IMU Body frame, when an event is received on the Mark input. If the **SETINSTRANSULATION** command (see page 922) and **SETINSROTATION** command (see page 919) have been entered with a MARKx parameter, the MARKxPVA log will contain the solution translated, and then rotated, by the values provided in the commands (e.g. **SETINSTRANSULATION MARK1** and **SETINSROTATION MARK1** commands for the MARK1PVA log). See the **SETINSTRANSULATION** command on page 922 and **SETINSROTATION** command on page 919.

The MARKxPVA logs available are dependent on the receiver used in the SPAN system. For information about the Event lines supported, see the Strobe Specifications for the receiver in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

These logs should only be requested with the ONCHANGED or ONTIME trigger.

These logs provide the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:**  
**1067 (MARK1PVA)**  
**1068 (MARK2PVA)**  
**1118 (MARK3PVA)**  
**1119 (MARK4PVA)**

#### Log Type: Synch

#### Recommended Input:

```
log mark1pva onnew
log mark2pva onnew
log mark3pva onnew
log mark4pva onnew
```

#### Abbreviated ASCII Example:

```
#MARK1PVAA, COM1, 0, 74.5, FINESTEERING, 1732, 247231.455, 02040020, 5790, 12002; 1732,

```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	MARKxPVA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Week	GNSS Week at Mark input	Ulong	4	H
3	Seconds	Seconds from week at Mark input	Double	8	H+4
4	Latitude	Latitude at Mark input (degrees)	Double	8	H+12
5	Longitude	Longitude at Mark input (degrees)	Double	8	H+20
6	Height	Height at Mark input (meters)	Double	8	H+28
7	North Velocity	Velocity in a northerly direction (a -ve value implies a southerly direction) at Mark input (meters/second)	Double	8	H+36
8	East Velocity	Velocity in an easterly direction (a -ve value implies a westerly direction) at Mark input (meters/second)	Double	8	H+44
9	Up Velocity	Velocity in an up direction at Mark input (meters/second)	Double	8	H+52
10	Roll	Right-handed rotation from local level around y-axis in degrees at Mark input (degrees)	Double	8	H+60
11	Pitch	Right-handed rotation from local level around x-axis in degrees at Mark input (degrees)	Double	8	H+68
12	Azimuth	Left-handed rotation around z-axis in degrees clockwise from North at Mark input (degrees)	Double	8	H+76
13	Status	INS Status, see <i>Table 225: Inertial Solution Status</i> on page 955 at Mark input	Enum	4	H+84
14	xxxx	32-bit CRC	Hex	4	H+88
15	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.39 PASHR

### *NMEA, Inertial Attitude Data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

The PASHR log uses a UTC time, calculated with default parameters, to output NMEA messages without waiting for a valid almanac. The UTC time status is set to WARNING since it may not be 100% accurate. When a valid almanac is available, the receiver uses the real parameters and sets the UTC time to VALID. For more information about NMEA, refer to *NMEA Standard Logs* on page 631. The PASHR log contains only INS derived attitude information and is only filled when an inertial solution is available.

As of firmware version 7.03.00, an INS status flag (field 12) has been added to the PASHR log. This change was made to match the industry accepted form of the message. Previous firmware versions on OEM7 and OEM6 do not output this field.

**Message ID:** 1177

**Log Type:** Synch

**Recommended Input:**

```
log pashr ontime 1
```

**Example:**

```
$PASHR,123816.80,312.95,T,-0.83,-0.42,-0.01,0.234,0.224,0.298,2,1*0B
```

Field	Structure	Description	Symbol	Example
1	\$PASHR	Log header. See <i>Messages</i> on page 30 for more information.	--	\$PASHR
2	Time	UTC Time	hhmmss.sss	195124.00
3	Heading	Heading value in decimal degrees The heading is the inertial azimuth calculated from the IMU gyros and the SPAN filters.	HHH.HH	305.30
4	True Heading	T displayed if heading is relative to true north.	T	T
5	Roll	Roll in decimal degrees. The ± sign will always be displayed.	RRR.RR	+0.05
6	Pitch	Pitch in decimal degrees. The ± sign will always be displayed.	PPP.PP	-0.13
7	Heave	Instantaneous heave in meters. The ± will always be displayed	Heave	+0.01
8	Roll Accuracy	Roll standard deviation in decimal degrees.	rr.rrr	0.180
9	Pitch Accuracy	Pitch standard deviation in decimal degrees.	pp.ppp	0.185

Field	Structure	Description	Symbol	Example
10	Heading Accuracy	Heading standard deviation in decimal degrees.	hh.hhh	4.986
11	GPS Update Quality Flag	0 = No position 1 = All non-RTK fixed integer positions 2 = RTK fixed integer position	1	1
12	INS Status Flag	0 = All SPAN Pre-Alignment INS Status 1 = All SPAN Post-Alignment INS Status - These include: INS_ALIGNMENT_COMPLETE, INS_SOLUTION_GOOD, INS_HIGH_VARIANCE, INS_SOLUTION_FREE	1	1
13	Checksum	Checksum	*XX	*2B
14	[CR][LF]	Sentence terminator		[CR][LF]

## 5.40 RAWDMI

### *Raw Distance Measurement Instrument (DMI) Measurements*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

This log contains the raw measurements from the Distance Measurement Instruments (DMI) connected to the receiver and enabled by the **DMICONFIG** command (see page 891).

RAWDMI can also be used as a command. If DMI inputs are not supported on the OEM7 receiver or IMU, the DMI wheel ticks can be collected by a separate device and sent to the receiver using RAWDMI as a command.

The RAWDMI command does not need to be sent if the SPAN system has a PwrPak7 receiver or one of the following NovAtel enclosure IMUs: IMU-ISA-100C, IMU-ENC-LN200, IMU-HG1900, IMU-μIMU-IC, IMU-IGM-A1, IMU-IGM-S1, IMU-FSAS or IMU-CPT. For these devices, connect the DMI to the DMI inputs on the PwrPak7 or IMU and SPAN system will collect the wheel tick.

**Message ID:** 2269

**Log Type:** Synch

**Recommended Input:**

```
log rawdmia onnew
```

**Example log:**

```
#RAWDMIA,COM1,0,24.0,FINESTEERING,2048,427043.137,02004048,b411,32768;2297,0,0,0,00000001*40c6ec74
```

**Command Abbreviate ASCII Syntax:**

```
RAWDMI DMI1 DMI2 DMI3 DMI4 Mask
```

**Command Example:**

```
RAWDMI 1000 0 0 0 1 (indicates 1000 wheel ticks from DMI1)
```

```
RAWDMI 0 0 0 2000 8 (indicates 2000 wheel ticks from DMI4)
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RAWDMI header	Log header. See <i>Messages</i> on page 30 for more information.	–	H	0
2	DMI1	DMI Input Value for DMI1	Long	4	H
3	DMI2	DMI Input Value for DMI2	Long	4	H+4
4	DMI3	DMI Input Value for DMI3	Long	4	H+8
5	DMI4	DMI Input Value for DMI4	Long	4	H+12

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
6	Mask	Mask to indicate which DMI inputs are used in the solution. Bit 0 = DMI1 Bit 1 = DMI2 Bit 2 = DMI3 Bit 3 = DMI4	Long	4	H+16
7	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+20
8	[CR][LF]	Sentence Terminator (ASCII only)	–	–	–

The DMI Input Values are interpreted based on the configuration of that input in the **DMICONFIG** command (see page 891).

Only DMI1 is currently supported.

## 5.41 RAWIMU

### *Raw IMU Data*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log contains an IMU status indicator and the measurements from the accelerometers and gyros with respect to the IMU enclosure frame. If logging this data, consider the **RAWIMUS** log (see page 1029) to reduce the amount of data.

The change in velocity (acceleration) and angle (rotation rate) scale factors for each IMU type can be found in *Table 250: Raw IMU Scale Factors* on page 1031. Multiply the appropriate scale factor by the count value for the velocity (field 5-7) and angle (field 8-10) increments.

To obtain acceleration in m/s/s or rotation rate in rad/s, multiply the velocity/rotation increments by the output rate of the IMU:

- 100 Hz for HG1700, HG1900, HG1930 and HG4930
- 125 Hz for STIM300, G320N, PwrPak7-E1, PwrPak7D-E1 and SMART7-S
- 200 Hz for ISA-100C, iMAR-FSAS, LN200, KVH1750, ADIS16488, G370N, G320N\_200Hz, PwrPak7-E2 and PwrPak7D-E2

The units of acceleration and rotation rate will depend on the IMU Scale Factors.

This log is output in the IMU Body frame.

#### **Logging Restriction Important Notice**

Logging excessive amounts of high rate data can overload the system. When configuring the output for SPAN, NovAtel recommends that only one high rate (>50Hz) message be configured for output at a time. It is possible to log more than one message at high rates, but doing so could have negative impacts on the system. Also, if logging 100/125/200Hz data, always use the binary format and, if possible, the short header binary format (available on most INS logs).

For optimal performance, log only one high rate output at a time. These logs could be:

- Raw data for post processing  
RAWIMUXSB ONNEW
  - RAWIMU logs are not valid with the ONTIME trigger. The raw IMU observations contained in these logs are sequential changes in velocity and rotation. As such, you can only use them for navigation if they are logged at their full rate.
- Real time INS solution  
IMURATEPVA ONNEW or IMURATEPVAS ONNEW

Other possible INS solution logs available at high rates are: INSPVASB, INSPOSSB, INSVELSB, INSATTSB

**Message ID: 268**

**Log Type: Asynch****Recommended Input:**

```
log rawimua onnew
```

**ASCII Example:**

```
#RAWIMUA,COM1,0,68.5,FINESTEERING,1724,219418.009,024c0040,6125,30019;1724,219418.008755000,00000077,64732,56,298,8,28,-3*7378486f
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset

## 5.42 RAWIMUS

### Short Raw IMU Data

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log is the short header version of the **RAWIMU** log (see page 1008).

The change in velocity (acceleration) and angle (rotation rate) scale factors for each IMU type can be found in *Table 250: Raw IMU Scale Factors* on page 1031. Multiply the appropriate scale factor by the count value for the velocity (field 5-7) and angle (field 8-10) increments.

To obtain acceleration in m/s/s or rotation rate in rad/s, multiply the velocity/rotation increments by the output rate of the IMU:

- 100 Hz for HG1700, HG1900, HG1930 and HG4930
- 125 Hz for STIM300, G320N, PwrPak7-E1, PwrPak7D-E1 and SMART7-S
- 200 Hz for ISA-100C, iMAR-FSAS, LN200, KVH1750, ADIS16488, G370N, PwrPak7-E2 and PwrPak7D-E2

The units of acceleration and rotation rate will depend on the IMU Scale Factors.

This log is output in the IMU Body frame.

#### Logging Restriction Important Notice

Logging excessive amounts of high rate data can overload the system. When configuring the output for SPAN, NovAtel recommends that only one high rate (>50Hz) message be configured for output at a time. It is possible to log more than one message at high rates, but doing so could have negative impacts on the system. Also, if logging 100/125/200Hz data, always use the binary format and, if possible, the short header binary format (available on most INS logs).

For optimal performance, log only one high rate output at a time. These logs could be:

- Raw data for post processing  
RAWIMUXSB ONNEW
  - RAWIMU logs are not valid with the ONTIME trigger. The raw IMU observations contained in these logs are sequential changes in velocity and rotation. As such, you can only use them for navigation if they are logged at their full rate.
- Real time INS solution  
IMURATEPVA ONNEW or IMURATEPVAS ONNEW

Other possible INS solution logs available at high rates are: INSPVASB, INSPOSSB, INSVELSB, INSATTSB

**Message ID: 325**

**Log Type: Async**

**Recommended Input:**

```
log rawimusa onnew
```

**ASCII Example:**

LSB = Least Significant Bit  
DataRate = 125 or 200 depending on configuration

<sup>1</sup> 1 G = 9.80665 m/s/s

## 5.43 RAWIMUSX

### *IMU Data Extended*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This is the short header version of the extended RAWIMUX log intended for use with post-processing. The extended version includes IMU information that is used by the NovAtel Inertial Explorer post-processing software.

The change in velocity (acceleration) and angle (rotation rate) scale factors for each IMU type can be found in *Table 250: Raw IMU Scale Factors* on page 1031. Multiply the appropriate scale factor by the count value for the velocity (field 7-9) and angle (field 10-12) increments.

To obtain acceleration in m/s/s or rotation rate in rad/s, multiply the velocity/rotation increments by the output rate of the IMU:

- 100 Hz for HG1700, HG1900, HG1930 and HG4930
- 125 Hz for STIM300, G320N, PwrPak7-E1, PwrPak7D-E1 and SMART7-S
- 200 Hz for ISA-100C, iMAR-FSAS, LN200, KVH1750, ADIS16488, G370N, PwrPak7-E2 and PwrPak7D-E2

The units of acceleration and rotation rate will depend on the IMU Scale Factors.

This log is output in the IMU Body frame.

#### **Logging Restriction Important Notice**

Logging excessive amounts of high rate data can overload the system. When configuring the output for SPAN, NovAtel recommends that only one high rate (>50Hz) message be configured for output at a time. It is possible to log more than one message at high rates, but doing so could have negative impacts on the system. Also, if logging 100/125/200Hz data, always use the binary format and, if possible, the short header binary format (available on most INS logs).

For optimal performance, log only one high rate output at a time. These logs could be:

- Raw data for post processing  
RAWIMUXSB ONNEW
  - RAWIMU logs are not valid with the ONTIME trigger. The raw IMU observations contained in these logs are sequential changes in velocity and rotation. As such, you can only use them for navigation if they are logged at their full rate.

## 5.45 RELINSPVA

### *Relative INSPVA log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the relative offset between the Master and Rover Inertial Solutions. The output solution provides the offset of where the local station is with respect to the other station.

This log should only be requested with the ONNEW trigger.

To use the **RELINSPVA** log, the receiver requires a Relative INS capable model.

**Message ID:** 1446

**Log Type:** Asynch

**Recommended Input:**

```
LOG RELINSPVAA ONNEW
```

**ASCII example:**

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	RELINSPVA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Output Frame	The current output frame (IMU body, ECEF or local level frame). The output frame is specified using the <b>SETRELINSOUTPUTFRAME</b> command (see page 927)	Enum	4	H
3	DeltaPosX	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the X-axis ECEF = along the X-axis Local level = Northing	Double	8	H+4

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
4	DeltaPosY	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the Y-axis ECEF = along the Y-axis Local level = Easting	Double	8	H+12
5	DeltaPosZ	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the Z-axis ECEF = along the Z-axis Local level = Up	Double	8	H+20
6	DeltaVelX	Difference in velocity between the two receivers (m/s). The position difference is relative to the output frame: BODY = along the X-axis ECEF = along the X-axis Local level = Northing	Double	8	H+28
7	DeltaVelY	Difference in velocity between two receivers (m/s). The position difference is relative to the output frame: BODY = along the Y-axis ECEF = along the Y-axis Local level = Easting	Double	8	H+36
8	DeltaVelZ	Difference in velocity between the two receivers (m/s). The position difference is relative to the output frame: BODY = along the Z-axis ECEF = along the Z-axis Local level = Up	Double	8	H+44
9	DeltaRoll	Difference in roll between the two receivers (degrees).	Double	8	H+52
10	DeltaPitch	Difference in pitch between the two receivers (degrees).	Double	8	H+60
11	DeltaHeading	Difference in heading between the two receivers (degrees).	Double	8	H+68
12	Diff Age	Differential age in seconds.	Float	4	H+76
13	Rover ID	Rover receiver ID string.	Char[4]	4	H+80
14	Rover INSStatus	INS status of the rover receiver. See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+84
15	Master ID	Master receiver ID string.	Char[4]	4	H+88
16	Master INSStatus	INS status of the master receiver. See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+92

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
17	RTK Status	Status of the current RTK vector between master and rover. See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+96
18	ExtStatus	Extended solution status. See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+100
20	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+104
21	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.46 SYNCHEAVE

### *Synchronous Log Containing the Instantaneous Heave Value*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

Synchronous heave is available up to the rate of the IMU. It can also be logged 'on time' at lower rates.

This log also includes information about the estimated accuracy of the heave value through the standard deviation of the heave. This heave solution is calculated at the location entered in the **SETINSTRANSLATION USER** command.

You must have an inertial solution to use this log.

Refer also to information in the **SETHEAVEWINDOW** command on page 912.

**Message ID:** 1708

**Log Type:** Synch

**Recommended Input:**

```
log syncheaveb ontime 0.05
```

**ASCII example:**

```
#SYNCHEAVEA,COM1,0,50.0,FINESTEERING,1770,245720.925,02000020,552e,12622;-  
0.045410579,0.436800622*b8c14286
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SYNCHEAVE Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Heave	Instantaneous heave value (meters)	Double	8	H
3	Std. Dev.	Standard deviation of the heave value (meters)	Double	8	H+8
4	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+16
5	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.47 SYNCRELINSPVA

### *Synchronous Relative INSPVA log*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides the relative offset between the master and rover inertial solutions. The output solution provides the offset of where the local station is with respect to the other station.

To use the **SYNCRELINSPVA** log, the receiver requires a Relative INS capable model.

This log is designed to provide synchronous, relative Position, Velocity and Attitude information, propagating the information between matched corrections between the master and remote solutions. It is highly recommended that the highest rate of corrections be used at all times for the most precise and robust performance.

**Message ID:** 1743

**Log Type:** Synch

**Recommended Input:**

```
LOG SYNCRELINSPVAA ONTIME 1
```

**ASCII example:**

```
#SYNCRELINSPVAA, COM1, 0, 72.5, FINESTEERING, 1805, 247243.000, 02000000, e9c7, 13005;
BODY, 8.141080733, -2.779177478, 2.045421773, -0.001464009, -0.001038329,
0.002323548, 0.409467974, 0.715633909, -6.204731538, 0.000000000, "B81V", INS_
ALIGNMENT_COMPLETE, "B20C", INS_ALIGNMENT_COMPLETE, INS_PSRSP, 00000000*e270f5c8
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	SYNCRELINSPVA Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	Output Frame	The current output frame (IMU body, ECEF or local level frame). The output frame is specified using the <b>SETRELINSOUTPUTFRAME</b> command (see page 927)	Enum	4	H
3	DeltaPosX	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the X-axis ECEF = along the X-axis Local level = Northing	Double	8	H+4

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
4	DeltaPosY	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the Y-axis ECEF = along the Y-axis Local level = Easting	Double	8	H+12
5	DeltaPosZ	Difference in the position between the two receivers (m). The position difference is relative to the output frame: BODY = along the Z-axis ECEF = along the Z-axis Local level = Up	Double	8	H+20
6	DeltaVelX	Difference in velocity between the two receivers (m/s). The position difference is relative to the output frame: BODY = along the X-axis ECEF = along the X-axis Local level = Northing	Double	8	H+28
7	DeltaVelY	Difference in velocity between two receivers (m/s). The position difference is relative to the output frame: BODY = along the Y-axis ECEF = along the Y-axis Local level = Easting	Double	8	H+36
8	DeltaVelZ	Difference in velocity between the two receivers (m/s). The position difference is relative to the output frame: BODY = along the Z-axis ECEF = along the Z-axis Local level = Up	Double	8	H+44
9	DeltaRoll	Difference in roll between the two receivers (degrees).	Double	8	H+52
10	DeltaPitch	Difference in pitch between the two receivers (degrees).	Double	8	H+60
11	DeltaHeading	Difference in heading between the two receivers (degrees).	Double	8	H+68
12	Diff Age	Differential age in seconds.	Float	4	H+76
13	Rover ID	Rover receiver ID string.	Char[4]	4	H+80
14	Rover INSStatus	INS status of the rover receiver. See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+84

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
15	Master ID	Master receiver ID string.	Char[4]	4	H+88
16	Master INSStatus	INS status of the master receiver. See <i>Table 225: Inertial Solution Status</i> on page 955	Enum	4	H+92
17	RTK Status	Status of the current RTK vector between master and rover. See <i>Table 81: Position or Velocity Type</i> on page 433	Enum	4	H+96
18	ExtStatus	Extended solution status. See <i>Table 226: Extended Solution Status</i> on page 960	Hex	4	H+100
20	xxxx	32-bit CRC (ASCII and Binary only)	Hex	4	H+104
21	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## 5.48 TAGGEDMARK1PVA, TAGGEDMARK2PVA, TAGGEDMARK3PVA and TAGGEDMARK4PVA

### *Position, Velocity and Attitude at a Tagged Mark Request*

Platform: OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7

TAGGEDMARKxPVA contains the same information as MARKxPVA with the addition of a unique identifying number (tag).

The TAGGEDMARKxPVA logs available are dependent on the receiver used in the SPAN system. For information about the Event lines supported, see the Strobe Specifications for the receiver in the [OEM7 Installation and Operation User Manual](#), [PwrPak7 Installation and Operation User Manual](#) or [SPAN CPT7 Installation and Operation User Manual](#).

The user specifies a TAG for the upcoming TAGGEDMARKxPVA via the **TAGNEXTMARK** command (see page 930). That tag shows up at the end of this message, which is otherwise identical to the MARKXPVA message.

These logs should only be requested with the ONCHANGED or ONTIME trigger.

These logs provide the position information in the user datum. To determine the datum being used, log the **BESTPOS** log (see page 429).

**Message ID:**  
**1258 (TAGGEDMARK1PVA)**  
**1259 (TAGGEDMARK2PVA)**  
**1327 (TAGGEDMARK3PVA)**  
**1328 (TAGGEDMARK4PVA)**

**Log Type: Synch**

**Recommended Input:**

```
log taggedmark1pva onnew
log taggedmark2pva onnew
log taggedmark3pva onnew
log taggedmark4pva onnew
```

**Abbreviated ASCII Example:**

```
#TAGGEDMARK1PVAA, COM1, 0, 63.0, FINESTEERING, 1732, 247787.965, 024c0020, ae1e, 12002;

16	[CR][LF]	Sentence Terminator (ASCII only)	-	-	-

## 5.49 TSS1

### *TSS1 Protocol for Heave, Roll and Pitch*

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

This log provides heave, roll and pitch information in TSS1 protocol.

This message is in a different format than any other log output by the SPAN system.

**Message ID:** 1456

**Log Type:** Synch

**Recommended Input:**

```
log tss1a ontime 1
```

**Message Format:**

```
:XXXXAAASMHHHHQMRRRRSMPPPP<CR><LF>
```

**ASCII Example:**

```
:00FFCA -0003F-0325 0319
```

Field	Field Type	Description	Symbol	Example
1	TSS1 Header	Log header. See <i>Messages</i> on page 30 for more information.	:	:
2	Horizontal Acceleration	Horizontal acceleration from 0 to 9.81 m/s <sup>2</sup> . Shown as a one byte unsigned hex number where the least significant bit = 3.83 cm/s <sup>2</sup> .	XX	00
3	Vertical Acceleration	Vertical acceleration from -20.48 to +20.48 m/s <sup>2</sup> . Shown as a two byte hex number where the least significant bit = 0.0625 cm/s <sup>2</sup> .	AAAA	FFCA
4	Space Character	A space delimiter.	S	
5	Heave Polarity	Space if positive. Minus sign (-) if negative.	M	-
6	Heave	Heave value from -99.99 to +99.99 m. Shown as a four digit integer where the least significant bit = 0.01 m.	HHHH	0003
7	Status Flag	F if INS Active. H if INS has not completed an alignment.	Q	F

Field	Field Type	Description	Symbol	Example
8	Roll Polarity	Space if positive. Minus sign (-) if negative.	M	-
9	Roll	Roll value from -99.99 to +99.99 degrees. Shown as a four digit integer where the least significant bit = 0.01 degrees.	RRRR	0325
10	Space Character	A space delimiter.	S	
11	Pitch Polarity	Space if positive. Minus sign (-) if negative.	M	
12	Pitch	Pitch value from -99.99 to +99.99 degrees. Shown as a four digit integer where the least significant bit = 0.01 degrees.	PPPP	0319
13	[CR][LF]	Sentence terminator	<CR><LF>	

## 5.50 VARIABLELEVERARM

### Display Variable Lever Arm Details

**Platform:** OEM719, OEM729, OEM7500, OEM7600, OEM7700, OEM7720, PwrPak7, SPAN CPT7, SMART7-S, SMART7-SI

Use this log to redisplay the re-calculated variable lever arm whenever a new **INPUTGIMBALANGLE** command is received. This message is output in the IMU body frame.

The **VARIABLELEVERARM** log will not be published or used internally unless a **SETINSROTATION RBM** command is sent. See the **SETINSROTATION** command on page 919.

This log should only be requested with the ONCHANGED or ONTIME trigger.

**Message ID:** 1320

**Log Type:** Asynch

**Recommended Input:**

```
log variableleverarma onnew
```

**ASCII Example:**

```
#VARIABLELEVERARMA, SPECIAL, 0, 81.5, FINESTEERING, 1614, 495820.512, 42040000, 0000, 320; -0.0959421909646755, 0.1226971902356540, 1.1319295452903300, 0.0100057787272846, 0.0122604827412661, 0.1131929545290330*9611d3c6
```

Field	Field Type	Description	Format	Binary Bytes	Binary Offset
1	VARIABLELEVERARM Header	Log header. See <i>Messages</i> on page 30 for more information.	-	H	0
2	XOffset	IMU body frame x-axis offset	Double	8	H
3	YOffset	IMU body frame y-axis offset	Double	8	H+8
4	ZOffset	IMU body frame z-axis offset	Double	8	H+16
5	XUncert	X-axis uncertainty in meters	Double	8	H+24
6	YUncert	Y-axis uncertainty in meters	Double	8	H+32
7	ZUncert	Z-axis uncertainty in meters	Double	8	H+40
8	xxxx	32-bit CRC (ASCII, Binary and Short Binary only)	Hex	4	H+48
9	[CR][LF]	Sentence terminator (ASCII only)	-	-	-

## Chapter 6 Responses

The receiver is capable of outputting several responses for various conditions. Most responses are error messages to indicate when something is not correct.

The output format of the messages is dependent on the format of the input command. If the command is input as abbreviated ASCII, the output will be abbreviated ASCII. The same rule applies for both ASCII and binary formats.

**Table 251: Response Messages**

ASCII Message	Binary Message ID	Meaning
OK	1	Command was received correctly
Requested log does not exist	2	The log requested does not exist
Not enough resources in system	3	The request has exceeded a limit (for example, the maximum number of logs are being generated)
Data packet doesn't verify	4	Data packet is not verified
Command failed on receiver	5	Command did not succeed in accomplishing requested task
Invalid Message ID	6	The input message ID is not valid
Invalid Message. Field = x	7	Field x of the input message is not correct
Invalid Checksum	8	The checksum of the input message is not correct. Only applies to ASCII and binary format messages.
Message missing field	9	A field is missing from the input message
Array size for field x exceeds max	10	Field x contains more array elements than allowed
parameter x is out of range	11	Field x of the input message is outside the acceptable limits
Message Id already exists in system	12	Message Id already exists in system
Debug token unknown	13	Debug token unknown
Trigger x not valid for this log	14	Trigger type x is not valid for this type of log
Authcode table full - Reload Software	15	Too many authcodes are stored in the receiver. The receiver firmware must be reloaded

ASCII Message	Binary Message ID	Meaning
Invalid date format	16	This error is related to the inputting of authcodes. Indicates the date attached to the code is not valid
Invalid Authcode entered	17	The authcode entered is not valid
No matching model to remove	18	The model requested for removal does not exist
Not valid Auth code for that Model	19	The model attached to the authcode is not valid
Channel is invalid	20	The selected channel is invalid
Requested rate is invalid	21	The requested rate is invalid
Word has no mask for this type	22	The word has no mask for this type of log
Channels locked due to error	23	Channels are locked due to error (the receiver must be reset or power cycled to track satellites again)
Injected time invalid	24	Injected time is invalid
Com port not supported	25	The COM or USB port is not supported
Message is incorrect	26	The message is invalid
Invalid PRN	27	The PRN is invalid
PRN not locked out	28	The PRN is not locked out
PRN lockout list is full	29	PRN lockout list is full
PRN already locked out	30	The PRN is already locked out
Message timed out	31	Message timed out
Unknown COM port requested	33	Unknown COM or USB port requested
Hex string not formatted correctly	34	Hex string not formatted correctly
Invalid baud rate	35	The baud rate is invalid
Message is invalid for this model	36	Message is invalid for this model of receiver
Could Not Save Configuration	38	Could Not Save Configuration
Too Many Configuration Items	39	Too Many Configuration Items

ASCII Message	Binary Message ID	Meaning
Command only valid if in NVM Fail mode	40	Command is only valid if NVM is in fail mode
Invalid offset	41	The offset is invalid
File conflict	43	File conflict
File not found	44	File not found
File open	45	File open
File not open	46	File not open
Invalid DOS FileName	47	Invalid DOS File name
File channel in use	48	File channel in use
File close fail	50	File close fail
Disk not present	51	Disk not present
Disk error	52	Disk error
Disk full	53	Disk full
NVM Write Fail	74	NVM Write Fail
NVM Read Fail	75	NVM Read Fail
Not allowed for input	77	Not allowed for input
Maximum number of user messages reached	78	Maximum number of user messages has been reached
User message decryption failed	79	User message decryption failed
GPS precise time is already known	84	GPS precise time is already known
The message could not be created	87	The message could not be created
Not enough memory to start application	113	Not enough memory to start application
No data available	114	No data available
Invalid handshaking	117	Invalid handshaking
Message name already exists	118	Message name already exists
Invalid message name	119	Invalid message name

ASCII Message	Binary Message ID	Meaning
The datatype is invalid	120	The data type is invalid
Message ID is reserved	121	Message ID is reserved
Message size too large	122	Message size too large
Invalid Security Key	126	Invalid security key
Hardware not available	127	Hardware not available
Requested pulse width is invalid	131	Requested pulse width is invalid
Coarse time is not achieved yet	133	Coarse time is not achieved yet
Invalid Config Code	134	Invalid Config Code
ConfigCode table full - Reload Software	135	Config Code table is full. Reload the software.
Unknown Object Type	136	Unknown object type
This operation is not valid at this time	137	This operation is not valid at this time
User VARF in use	140	User VARF in use
Must enable CLOCKADJUST	141	Must enable CLOCKADJUST. See the <b>CLOCKADJUST</b> command on page 103 for information about enabling.
Disk busy	142	Disk busy
Invalid Word Input Argument	143	Invalid Word Input Argument
Parameter %d is not valid for this model	148	The parameter specified is not valid for this model
IMU SPECS LOCKED FOR THIS IMU TYPE	150	SPAN allows the default specifications for a select few IMUs to be modified to support different variants. However, most IMU specifications are not allowed to change.
Invalid interface mode. Parameter %d	151	The specified Interface mode parameter is not valid.
COMMAND INVALID FOR THIS IMU	154	The entered command cannot be used with the configured IMU. For example, the <b>INSCALIBRATE ANT1</b> command is not valid for lower quality IMUs.
IMU protocol is locked for this IMU type	155	IMU protocol is locked for this IMU type

ASCII Message	Binary Message ID	Meaning
IMU TYPE IS NOT SUPPORTED WITH CURRENT MODEL	157	A firmware model upgrade is required to use the requested IMU ( <b>CONNECTIMU</b> command on page 889).
Trigger start time is invalid	159	Trigger start time is invalid
Sensor is not initialized	160	Sensor is not initialized
TRIGGER BUFFER IS FULL	161	The <b>TIMEEVENTPULSE</b> command (see page 931) limit of 10 events has been reached, and a new event cannot be set until an event is cleared.
Board has not achieved finesteering	162	The receiver has not achieved finesteering
SETUPSENSOR COMMAND IS LOCKED	163	The <b>SETUPSENSOR</b> command (see page 928) cannot be modified because there are remaining trigger events queued.
Invalid Profile Name	165	Invalid Profile Name
Maximum Number Profiles Exceeded	166	The maximum number of profiles is exceeded
Failed To Delete Profile	167	Failed to delete the profile
Profile Name Already Exists	168	Profile name already exists
Total Profile Commands Size Over Limit	169	Total Profile commands size over limit
Cannot Change Profile When Activated	170	Cannot change a Profile when it is activated
Signature Authcode Copy Fail	171	Signature Authcode copy fail
Maximum Number of Profile Commands Exceeded	172	The maximum number of <b>PROFILE</b> commands exceeded
Profile Active, Could Not Save Configuration	173	Profile active, could not save configuration
Current PPP position has bad status and cannot be used for seeding	178	Current PPP position has bad status and cannot be used for seeding
PPP seed position failed integrity check	179	PPP seed position failed integrity check
Invalid password	180	Invalid password

ASCII Message	Binary Message ID	Meaning
Too many files	181	Too many files
Encryption key output is not allowed	186	Encryption key output is not allowed
Secure port requires login	187	Secure port requires login
NMEA2000/J1939 stack is already running on the CAN port	188	NMEA2000/J1939 stack is already running on the CAN port
No saved PPP seed position	191	No saved PPP seed position
System type is invalid for this model	192	System type is invalid for this model

Region not set	226	Region not set
Estimated RBV must be entered first	227	Initial RBV estimate is required before RBV calibration

# APPENDIX A Example of Bit Parsing a RANGEEMP4 Log

The following takes a sample RANGEEMP4 log and breaks it down into its raw components.

Data was captured in both RANGE and in RANGEEMP4 logs which are shown here for reference. These logs were captured at a rate of 4 Hz such that the Reference and Differential parts of the RANGEEMP4 could be explained.

Some of the RANGEEMP4 values will have some very slight differences (at the millicycle level) compared to the equivalent RANGE log data due to truncating the double values into integers.

Here are two RANGE logs to reference against once the RANGEEMP4 logs have been determined:

```

### A.1.3 Reference Measurement Block Header: GPS

This block is sent once for each bit set to 1 in the Satellites field found in *Table 162: Satellite and Signal Block* on page 723. Now that the PRN's signals have been determined, the next step is to determine the specifics of the first PRN (10) and its list of signals (L1CA, L2Y, L5Q). Working from bottom right to upper left of the PRN/Signal chart above, each 1 represents a signal for a PRN. Use *Table 163: Measurement Block Header* on page 724 to determine the contents of each field:

*GPS PRN 10* (first PRN found in the Satellites field)

We will grab enough bytes to process the whole Measurement Block Header. If this was a GLONASS System, a total of 9 bits would be required for this step (1 bit for the Data Format Flag, 3 bits for the Ref Data Block ID, plus 5 bits for the GLONASS Frequency Number). Since this is a GPS system, only 4 bits in total are required (1 bit for the Data Format Flag and 3 bits for the Ref Data Block ID).

There was 1 bit not processed in the last byte so that byte will be carried forward. Only 4 bits need to be looked at for this step so grab the next byte as well:

- Use the last byte (0x76) plus the next byte (0x88)= 0x7688
- Swap the bytes = 0x8876
- 0x8876 in binary form = 1000100001110110
- Ignore the 7 processed bits from the last step = 100010000XXXXXX
- Ignore the 5 MSB bits leaving 4 bits for processing =

XXXXX0000XXXXXX

0 = Data Format Flag (1 bit)  
000 = Ref Data Block (3 bits)

The Data Format Flag identifies that this batch of data is Reference (0) data.  
The Ref Data Block ID is 0x000.

The 5 MSBs have not been processed so this byte will be carried forward.

The Data Format Flag identifies if the upcoming data is Reference or Differential data. By default every log that was published on a whole second will always be Reference logs. Logs between seconds will be Differential logs but could be Reference logs depending on the compression calculations. If a discontinuity occurred that made it impossible for a Differential calculation to fit within the Differential Constraints, it will revert to a Reference log.

### A.1.4 Reference Measurement Block: GPS

This block is sent once for each bit set to 1 in the Included Signals Field found in *Table 162: Satellite and Signal Block* on page 723. Use *Table 164: Primary Reference Signal Measurement Block* on page 725 and *Table 165: Secondary Reference Signals Measurement Block* on page 726 to determine the contents of each field:

A Measurement Block for a single PRN will look like the following:

Primary Parity Flag  
Primary ½ Cycle Slip Flag  
Primary C/No  
Primary Lock Time  
Primary Pseudorange Std Deviation  
Primary Phaserange Std Deviation

Primary Pseudorange

Primary Phaserange - Primary Pseudorange (determines the Phaserange for the 1<sup>st</sup> Signal)

Primary Doppler

2<sup>nd</sup> Parity Flag

2<sup>nd</sup> ½ Cycle Slip Flag

2<sup>nd</sup> C/No

2<sup>nd</sup> Lock Time

2<sup>nd</sup> Pseudorange Std Deviation

2<sup>nd</sup> Phaserange Std Deviation

2<sup>nd</sup> Pseudorange - Primary Pseudorange (determines the Pseudorange for the 2<sup>nd</sup> Signal)

2<sup>nd</sup> Phaserange - 2<sup>nd</sup> Pseudorange (determines the Phaserange for the 2<sup>nd</sup> Signal)

2<sup>nd</sup> Doppler - Primary Doppler (determines the Doppler for the 2<sup>nd</sup> Signal)

3<sup>rd</sup> Parity Flag

3<sup>rd</sup> ½ Cycle Slip Flag

3<sup>rd</sup> C/No

3<sup>rd</sup> Lock Time

3<sup>rd</sup> Pseudorange Std Deviation

3<sup>rd</sup> Phaserange Std Deviation

3<sup>rd</sup> Pseudorange - Primary Pseudorange (determines the Pseudorange for the 3<sup>rd</sup> Signal)

3<sup>rd</sup> Phaserange - 3<sup>rd</sup> Pseudorange (determines the Phaserange for the 3<sup>rd</sup> Signal)

3<sup>rd</sup> Doppler - Primary Doppler (determines the Doppler for the 3<sup>rd</sup> Signal)

...

### **A.1.5 Reference Primary Signal Measurement Block: GPS PRN 10 – L1CA**

The next bytes collected will be for the GPS PRN 10 - L1CA signal data. This is the primary signal of the PRN since it is the first signal. As a result, its Measurement Block consists of 111 bits as listed in *Table 164: Primary Reference Signal Measurement Block* on page 725. Since 111 bits takes up a lot of space, these bits will be split into two groups from *Table 164: Primary Reference Signal Measurement Block* on page 725: the top 25 bits for signal info followed by the bottom 86 bits for signal data.

The signal info section (top 25 bits) is processed as follows:

- With 5 bits left unprocessed from the previous byte, we calculate  $25 - 5 = 20$  bits which rounds up to 3 bytes. Therefore the previous last byte (0x88) plus the next 3 bytes will be needed.
  - Use the last byte (0x88) plus grab 3 bytes (x831f61) = 0x88831f61
  - Swap the bytes = 0x611f8388

- 0x611f8388 in binary form = 01100001000111111000001110001000
- The previous step used the 3 LSBs = 01100001000111111000001110001XXX
- 25 bits are needed so ignore the 4 MSBs =

```

xxxx0001000111111000001110001xxx
                                1   = Parity Flag
                                0   = 1/2 Cycle Slip Flag
                        10000011100   = C/No
                1111
        0001
0001
                                = Lock Time
                                = Pseudorange Std Deviation
                                = Phasorange Std Deviation
    
```

- Parity flag is a 1 (Parity Known)
- 1/2 Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
0x10000011100b = 1052 x Scaling Factor of 0.05  
= 52.60 dBHz
- The Lock Time value is:  
0x1111b = 15 which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
0x0001b = 1 which means: 0.020 m < PSR Std Dev <= 0.030 m using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
0x0001b = 1 which means: 0.0039 < ADR Std Dev <= 0.0052 cycles using *Table 170: ADR Std Dev* on page 731.

The signal data section (bottom 86 bits) is processed as follows:

- With 4 bits unprocessed from the previous byte, we calculate 86 – 4 = 82 bits = 11 bytes (2 bits will not be processed in the last byte).
  - Use the last byte (0x61) plus grab 11 bytes (0x1fd87ca0b03a00638bbdf7)  
= 0x611fd87ca0b03a00638bbdf7
  - Swap the bytes = 0xf7bd8b63003ab0a07cd81f61
  - 0xf7bd8b63003ab0a07cd81f61 in binary form =  
111 0111 1011 1101 1000 1011 0110 0011 0000 0000 0011 1010 1011 0000 1010 0000 0111 1100 1101  
1000 0001 1111 0110 0001
  - Only need 86 bits. Ignore last 4 LSBs and first 6 MSBs =

```

xxxx xx11 1011 1101 1000 1011 0110 0011 0000 0000 0011 1010 1011 0000 1010 0000 0111 1100 1101 1000 0001 1111 0110 xxxx
                                0 1010 0000 0111 1100 1101 1000 0001 1111 0110
                                0000 0000 0011 1010 1011 000
11 1011 1101 1000 1011 0110 0011
                                = 1st Pseudo
                                = 1st Phase - 1st Pseudo
                                = 1st Doppler
    
```

- Use *Table 164: Primary Reference Signal Measurement Block* on page 725 to identify if a 2's Complement Conversion is needed as well as what Scale Factor should be used before these binary numbers are used in the following calculations.
- The 1st (Primary) Pseudorange is processed by:  
1st Pseudorange = 0x0101000000111110011011000000111110110b x Scaling Factor  
1st Pseudorange = 4380581622 x 0.0005  
L1CA Pseudorange for PRN 10= 21540290.811 m

- The 1st (Primary) Phasorange is a 2's Complement number (as identified by the Range column in *Table 164: Primary Reference Signal Measurement Block* on page 725) so it is processed in the following manner:

1st Phasorange – 1st Pseudorange = 2's Complement(0x0000000001110101011000b) \* Scaling Factor  
 1st Phasorange – 21540290.811 m = 7512 \* 0.0001  
 L1CA Phasorange = 21540291.5622 m

- Convert this to ADR to check against the original RANGE log:

ADR = 1st Phasorange \* Frequency \* (-1)/Speed Of Light  
 ADR = 21540291.5622 m \* 1575420000 Hz \* (-1)/299792458 m/s  
 L1CA ADR for PRN 10 = -113194996.1627158 cycles

In the range logs, PSR and ADR have opposite signs.

- The 1st (Primary) Doppler is a 2's Complement number (as identified by the Range column in *Table 164: Primary Reference Signal Measurement Block* on page 725) so it is processed in the following manner:

1st Doppler(m/s) = 2's Complement(0x11101111011000101101100011b) x Scaling Factor  
 1st Doppler(m/s) = -4,355,229 x 0.0001  
 L1CA Doppler(m/s) = -435.5229 m/s

Convert the Doppler to Hz:

1st Doppler(Hz) = 1st Doppler(m/s) x Frequency \* (-1)/Speed Of Light  
 L1CA Doppler(Hz) for PRN 10 = 2288.6883 Hz  
 1st Doppler(Hz) = -435.5229 m/s x 1575420000 Hz \* (-1)/299792458 m/s

### A.1.6 Reference Secondary Signals Measurement Block: GPS PRN 10 – L2Y

Signal L1CA was the 1st signal (Primary Signal) of the three PRN 10 signals found in this RANGEEMP4 log data. L1CA's data is now used to determine the L2Y's signals data. Since this is the second signal block of this PRN, its data will be processed by using *Table 165: Secondary Reference Signals Measurement Block* on page 726.

With 6 bits left unprocessed from the previous byte, we will require 82 – 6 = 76 bits which rounds up to 10 bytes.

- Use the last byte (0xf7) plus grab the next 10 bytes (0xb82f49b080fd0ec0ff1f) = 0xf7b82f49b080fd0ec0ff1f
- Swap the bytes = 0x1fffc00efd80b0492fb8f7
- 0x1fffc00efd80b0492fb8f7 in binary form =  
 0001 1111 1111 1111 1100 0000 0000 1110 1111 1101 1000 0000 1011 0000 0100 1001 0010 1111 1011 1000 1111 01XX  
 1111 0111
- Only need 78 bits. The 2 LSBs are ignored as they were already processed above and the 4 MSBs are ignored so there is a total of 82 bits to process

```

xxxx 1111 1111 1111 1100 0000 0000 1110 1111 1101 1000 0000 1011 0000 0100 1001 0010 1111 1011 1000 1111 01XX
                                                                 1 = Parity Flag
                                                                 0 = 1/2 Cycle Slip Flag
                                                                 011 1000 1111 = C/No
                                                                 111 1 = Lock Time
                                                                 010 1 = Pseudorange Std Deviation
                                                                 001 0 = Phasorange Std Deviation
                                                                 000 0000 1011 0000 0100 1 = Pseudo - 1st Pseudo
                                                                 00 0000 0000 1110 1111 1101 1 = Phase - Pseudo
1111 1111 1111 11
    
```

Use *Table 165: Secondary Reference Signals Measurement Block* on page 726 to identify if a 2's Complement Conversion is needed as well as what Scale Factor should be used before these binary numbers are used in the following calculations.

- Parity flag is a 1 (Parity Known)
- ½ Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
 $0x01110001111b = 911 \times \text{Scaling factor of } 0.05$   
 $= 45.55 \text{ dBHz}$
- The Lock Time value is:  
 $0x1111b = 15$  which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
 $0x0101b = 5$  which means:  $0.099 \text{ m} < \text{PSR Std Dev} \leq 0.148 \text{ m}$  using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
 $0x0010b = 2$  which means:  $0.0052 < \text{ADR Std Dev} \leq 0.0070$  cycles using *Table 170: ADR Std Dev* on page 731.
- The L2Y Pseudorange is a 2's Complement number (as identified by the Range column in *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is processed in the following manner:  
 $\text{Pseudorange} - 1\text{st Pseudorange} = 2\text{'s Complement}(0x00000001011000001001b) \times \text{Scaling Factor}$   
 $\text{Pseudorange} - 21540290.811 \text{ m} = 5641 \times 0.0005$   
 $2Y \text{ Pseudorange} = 21540293.6315 \text{ m}$
- The L2Y Phaserange is a 2's Complement number (as identified by the Range column in *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is calculated in the following manner:  
 $\text{Phaserange} - \text{Pseudorange} = 2\text{'s Complement}(0x00000000001110111111011b) \times \text{Scaling Factor}$   
 $\text{Phaserange} - 21540293.6315 \text{ m} = 7675 \times 0.0001$   
 $L2Y \text{ Phaserange} = 21540294.399 \text{ m}$
- Convert this to ADR to check against the original RANGE log:  
 $\text{ADR} = \text{Phaserange} \times \text{Frequency} \times (-1) / \text{Speed Of Light}$   
 $\text{ADR} = 21540294.399 \text{ m} \times 1227600000 \text{ Hz} \times (-1) / 299792458 \text{ m/s}$   
 $L2Y \text{ ADR for PRN } 10 = -88203904.73002626 \text{ cycles}$

In the range logs, PSR and ADR have opposite signs.

- The L2Y Doppler is a 2's Complement number (as identified by the Range Column in *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is calculated in the following manner:  
 $\text{Doppler(m/s)} - 1\text{st Doppler(m/s)} = 2\text{'s Complement}(0x11111111111111b) \times \text{Scaling Factor}$   
 $\text{Doppler(m/s)} - (-435.5229 \text{ m/s}) = (-1) \times 0.0001$   
 $L2Y \text{ Doppler(m/s)} = -435.5228 \text{ m/s}$   
 Convert the Doppler to Hz:  
 $\text{Doppler(Hz)} = \text{Doppler(m/s)} \times \text{Frequency} \times (-1) / \text{Speed Of Light}$   
 $\text{Doppler(Hz)} = -435.5228 \text{ m/s} \times 1227600000 \text{ Hz} \times (-1) / 299792458 \text{ m/s}$   
 $L2Y \text{ Doppler(Hz) for PRN } 10 = 1783.3938 \text{ Hz}$

### A.1.7 Reference Third Signals Measurement Block: GPS PRN 10 – L5Q

Signal L1CA was the 1st signal (Primary Signal) of the three PRN 10 signals found in this RANGEEMP4 log data. L1CA's data is now used to determine the L5Q's signals data. Since this is the third signal block of this

PRN, its data will be processed using *Table 165: Secondary Reference Signals Measurement Block* on page 726.

With 4 bits left unprocessed from the previous byte, we will require  $82 - 4 = 78$  bits which rounds up to 10 bytes.

- Use the last byte (0x1f) plus grab the next 10 bytes (0x091f8214ff4d4d00a100)  
= 0x1f091f8214ff4d4d00a100
- Swap the bytes = 0x00a1004d4dff14821f091f
- 0x00a1004d4dff14821f091f in binary form =  
0000 0000 1010 0001 0000 0000 0100 1101 0100 1101 1111 1111 0001 0100 1000 0010 0001 1111 0000 1001 0001 1111
- Only need 78 bits. The 4 LSBs are ignored as they were already processed above and the 2 MSBs are ignored so there is a total of 82 bits to process

```

xx00 0000 1010 0001 0000 0000 0100 1101 0100 1101 1111 1111 0001 0100 1000 0010 0001 1111 0000 1001 0001 xxxx
                                                                                               1
                                                                                               0
                                                                                   1 0000 1001 00
                                                                                   1 111
                                                                                   0 000
                                                                                   0 001
                                                                                   1 1111 1111 0001 0100 100
00 0000 1010 0001 0000 0000 0100 1101 0100 110
00 0000 1010 0001
    
```

= Parity Flag  
 = ½ Cycle Slip Flag  
 = C/No  
 = Lock Time  
 = Pseudorange Std Deviation  
 = Phaserange Std Deviation  
 = Pseudo - 1st Pseudo  
 = Phase - Pseudo  
 = Doppler - 1st Doppler

Use *Table 165: Secondary Reference Signals Measurement Block* on page 726 to identify if a 2's Complement Conversion is needed as well as what Scale Factor should be used before these binary numbers are used in the following calculations.

- Parity flag is a 1 (Parity Known)
- ½ Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
0x10000100100b = 1060 x Scaling Factor of 0.05  
= 53.00 dBHz
- The Lock Time value is:  
0x1111b = 15 which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
0x0000b = 0 which means: PSR Std Dev <= 0.020 m using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
0x0001b = 1 which means: 0.0039 < ADR Std Dev <= 0.0052 cycles using *Table 170: ADR Std Dev* on page 731.
- The L5Q Pseudorange is a 2's Complement number (as identified by Range column in *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is processed in the following manner:  
Pseudorange – 1st Pseudorange = 2's Complement(0x11111111100010100100b) x Scaling Factor  
Pseudorange – 21540290.811 m = (-1884) x 0.0005  
L5Q Pseudorange = 21540289.869 m
- The L5Q Phaserange is a 2's Complement number (as identified by the Range column in *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is calculated in the following manner:  
Phaserange – Pseudorange = 2's Complement(0x0000000010011010100110b) \* Scaling Factor  
Phaserange – 21540289.869 m = 9894 \* 0.0001  
L5Q Phaserange = 21540290.8584 m
- Convert this to ADR to check against the original RANGE log:

$ADR = \text{Phaserange} * \text{Frequency} * (-1)/\text{Speed Of Light}$   
 $ADR = 21540290.8584 \text{ m} * 1176450000 \text{ Hz} * (-1)/299792458 \text{ m/s}$   
 L5Q ADR for PRN 10 = -84528728.13886692 cycles

In the range logs, PSR and ADR have opposite signs.

- The L5Q Doppler is a 2's Complement number (as identified by the Range column *Table 165: Secondary Reference Signals Measurement Block* on page 726) so it is calculated in the following manner:

$\text{Doppler(m/s)} - 1\text{st Doppler(m/s)} = 2\text{'s Complement}(0x00000010100001b) * \text{Scaling Factor}$   
 $\text{Doppler(m/s)} - (-435.5229 \text{ m/s}) = 80 * 0.0001$   
 $\text{L5Q Doppler(m/s)} = -435.5149 \text{ m/s}$

Convert the Doppler to Hz:

$\text{Doppler(Hz)} = \text{Doppler(m/s)} * \text{Frequency} * (-1)/\text{Speed Of Light}$   
 $\text{Doppler(Hz)} = -435.5149 \text{ m/s} * 1176450000 \text{ Hz} * (-1)/299792458 \text{ m/s}$   
 L5Q Doppler(Hz) for PRN 10 = 1709.054 Hz

This concludes the processing of the signals present for PRN 10.

The next PRN as identified in the GPS Included Signals Field is PRN 15 with 2 signals. Processing of this data would be handled as described above, starting with the 4 bit Measurement Block followed by the individual signals. This would be followed by PRN 18, 21, and 27. Processing these remaining PRNs and their signals would use up the next 870 bits as shown below:

Bits required for remaining GPS PRNs and Signals:

PRN 15

- 4 bits Measurement Block header
- 111 bits - 1st Signal
- 82 bits - 2nd Signal

PRN 18

- 4 bits Measurement Block header
- 111 bits - 1st Signal
- 82 bits - 2nd Signal

PRN 21

- 4 bits Measurement Block header
- 111 bits - 1st Signal
- 82 bits - 2nd Signal

PRN 27

- 4 bits Measurement Block header
- 111 bits - 1st Signal
- 82 bits - 2nd Signal
- 82 bits - 3rd Signal

Total = 870 bits

- Ignore the processed bits = 1111000000010010XXXX
- Determine the required 16 bits =

- The 1's above identify that there are 2 tracking GLONASS signals: L1CA and L2P.

*GLONASS Included Signals field* (5 Slot ID's x 2 Signals = 10 bits)

- Append the next byte (0x3f) to the last byte (0xf0) = 0xf03f
- Swap the bytes = 0x3ff0
- 0x3ff0 in binary form = 0011111111110000
- Ignore the processed bits = 001111111111XXXX
- Determine the required 10 bits = XX1111111111XXXX
- This bit string breaks down into 5 rows (Slots) and 2 columns (signals) as specified by the mxn (Slot IDs x signals) parameters. Take the bit string and break it up into sets of 2 starting at the MSB. This will result with the lowest Slot ID being at the bottom row of the stack and the first signal (L1CA) being the far right column.

```

11
11
11
11
11

```

- This stack can be further broken apart to identify the Slot ID's vs. their Signals:

SLOT	L2P	L1CA
24	1	1
18	1	1
17	1	1
2	1	1
1	1	1

### A.1.9 Reference Measurement Block Header: GLONASS PRN 38

(Slot 1 which was the first Slot found in the Satellites Field)

We will grab enough bytes to process the whole Measurement Block Header. Since this is a GLONASS System, a total of 9 bits will be required for this step (1 bit for the Data Format Flag, 3 bits for the Ref Data Block ID, plus 5 bits for the GLONASS Frequency Number).

With 2 bits left unprocessed from the previous byte, we will require  $9 - 2 = 7$  bits which rounds up to 1 byte:

- Use the last byte (0x3f) plus the next byte (0xa0)= 0x3fa0
- Swap the bytes = 0xa03f
- 0xa03f in binary form = 1010000000111111
- Ignore the 6 processed bits from the last step = 1010000000XXXXXX

- Ignore the 1 MSB bits leaving 9 bits for processing =

```

X010000000XXXXXX
      0           = Data Format Flag (1 bit)
    000         = Ref Data Block (3 bits)
  01000       = GLONASS Freq Number (5 bits)
    
```

The Data Format Flag identifies that this batch of data is Reference (0) data.

The Ref Data Block ID is 0x000.

The GLONASS Frequency Number is 8 (adjusted to 1). When calculating the GLONASS Carrier frequency, this value (0 to 20) will be adjusted to its -7 to +13 value and then multiplied by that frequencies delta. Note that this field only appears in the Reference data and will not be found in the Differential data.

**Special Case:** When the Slot ID is between 43 and 63, the Slot ID of the GLONASS satellite is unknown. In order to keep track of which satellite it is for these calculations, the Frequency Number is used to assign this GLONASS Satellite a temporary Slot ID based on the GLONASS Frequency Numbers binary value of 0 to 20.

### A.1.10 Reference Primary Signal Measurement Block: GLONASS PRN 38 – L1CA

The next bytes collected will be for the GLONASS PRN 38 - L1CA signal data. This is the primary signal of the satellite since it is the first signal. As a result, its Measurement Block consists of 111 bits as listed in *Table 164: Primary Reference Signal Measurement Block* on page 725. Since 111 bits takes up a lot of space, these bits will be split into two groups from *Table 164: Primary Reference Signal Measurement Block* on page 725: the top 25 bits for signal info followed by the bottom 86 bits for signal data.

The signal info section (top 25 bits) is processed as follows:

- With 1 bit left unprocessed from the previous byte, we calculate  $25 - 1 = 24$  bits which equals 3 bytes. Therefore the previous last byte (0xa0) plus the next 3 bytes will be needed.
  - Use the last byte (0xa0) plus grab 3 bytes (x19f813) = 0xa019f813
  - Swap the bytes = 0x13f819a0
  - 0x13f819a0 in binary form = 00010011111110000001100110100000
  - The previous step used the 7 LSBs = 0001001111111000000110011XXXXXX
  - Need 25 bits which is exactly what is left over:

```

0001001111111000000110011XXXXXX
                        1           = Parity Flag
                        1           = ½ Cycle Slip Flag
                    10000001100     = C/No
                1111                 = Lock Time
            0011                     = Pseudorange Std Deviation
    0001                             = Phasorange Std Deviation
    
```

- Parity flag is a 1 (Parity Known)
- ½ Cycle Slip flag is a 1 (Cycle Slip Present)
- C/No is:  
 $0x10000001100b = 1036 \times \text{Scaling factor of } 0.05$   
 $= 51.80 \text{ dBHz}$

- The Lock Time value is:  
0x1111b = 15 which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
0x0011b = 3 which means: 0.045 m < PSR Std Dev <= 0.066 m using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
0x0001b = 1 which means: 0.0039 < ADR Std Dev <= 0.0052 cycles using *Table 170: ADR Std Dev* on page 731.

The signal data section (bottom 86 bits) is processed as follows:

- With no unprocessed bits from the previous byte, we need 86 bits which rounds up to 11 bytes.
  - Grab 11 bytes = 0x6a11273649b8fcefab9c43
  - Swap the bytes = 0x439cabeffcb8493627116a
  - 0x439cabeffcb8493627116a in binary form =  
0100 0011 1001 1100 1010 1011 1110 1111 1111 1100 1011 1000 0100 1001 0011 0110 0010 0111 0001  
0001 0110 1010
  - Only need 86 bits. Ignore first 2 MSBs =

```

xx00 0011 1001 1100 1010 1011 1110 1111 1111 1100 1011 1000 0100 1001 0011 0110 0010 0111 0001 0001 0110 1010
                                0 1001 0011 0110 0010 0111 0001 0001 0110 1010 = 1st Pseudo
                                1111 1111 1100 1011 1000 010  = 1st Phase - 1st Pseudo
00 0011 1001 1100 1010 1011 1110                                     = 1st Doppler
    
```

- Use *Table 164: Primary Reference Signal Measurement Block* on page 725 to identify if a 2's Complement Conversion is needed as well as what Scale Factor should be used before these binary numbers are used in the following calculations.
- The 1st (Primary) Pseudorange is processed by:  
1st Pseudorange = 0x0100100110110001001110001000101101010b x Scaling Factor  
1st Pseudorange = 39563235690 x 0.0005  
L1CA Pseudorange for PRN 38 = 19781617.845 m
- The 1st (Primary) Phaserange is a 2's Complement number (as identified by the Range column in *Table 164: Primary Reference Signal Measurement Block* on page 725) so it is processed in the following manner:  
1st Phaserange – 1st Pseudorange = 2's Complement(0x11111111110010111000010b) \* Scaling Factor  
1st Phaserange – 19781617.845 m = -6718 \* 0.0001  
L1CA Phaserange = 19781617.1732 m
- Convert this to ADR to check against the original RANGE log:  
ADR = 1st Phaserange \* (Carrier Frequency + Frequency Number \* 562500 Hz) \* (-1)/Speed Of Light  
ADR = 19781617.1732 m \* (1602000000 Hz + 1 \* 562500 Hz) \* (-1)/299792458 m/s  
ADR = 19781617.1732 m \* 1602562500 Hz \* (-1)/299792458 m/s  
L1CA ADR for PRN 38 = -105744080.6970745 cycles

 In the range logs, PSR and ADR have opposite signs.

- The 1st (Primary) Doppler is a 2's Complement number (as identified by the Range column in *Table 164: Primary Reference Signal Measurement Block* on page 725) so it is processed in the following manner:

1st Doppler(m/s) = 2's Complement(0x00001110011100101010111110b) x Scaling Factor

1st Doppler(m/s) = 3787454 m/s x 0.0001

L1CA Doppler(m/s) = 378.7454 m/s

Convert the Doppler to Hz:

1st Doppler(Hz) = 1st Doppler(m/s) x (Carrier Frequency + Frequency Number \* 562500 Hz) \* (-1)/Speed Of Light

1st Doppler(Hz) = 378.7454 m/s x (1602000000 Hz + 1 \* 562500 Hz) \* (-1)/299792458 m/s

1st Doppler(Hz) = 378.7454 m/s x 1602562500 Hz \* (-1)/299792458 m/s

L1CA Doppler(Hz) for PRN 38 = -2024.6112 Hz

The rest of the GLONASS Reference Signals are handled in a similar manner as described in the above GPS section.

## A.2 Differential Log Decoding

Logs not falling on a whole second are most likely Differential logs which are processed differently than the Reference logs. It is possible for a sub-second RANGEEMP4 log to be a Reference log if the data contained within it did not fit the tight Differential Compression requirements.

Differential logs use the reference data of the same signal unlike reference logs which uses the first signal to define the other signals.

The next RANGEEMP4 log is at time 507977.250:

```
#RANGEEMP4A, COM1, 0, 88.5, FINESTEERING, 1919, 507977.250, 02000020, fb0e, 32768;239,
030000421204000000009200dff688831f6102005500e70162dc977c004015c07988840f6101803
a805921cedf8b80002011207080e5f6351f003804081c2200be0808005c01620808725f93028057
801822dae0476000a00f207180fef6251700e803401c62f3bdc8060052013009986f5f220200540
04ca2053ec408005401ca870180410000000000980ff6306fec408004801de07c8692f51028051
80f721b2e04f600040152081804ef7102500600540202205fe040a0086013a0938780f610200618
04e224edbdb68002010c0498030f7411d0018047812a2d47d090a004c01a609c8544f6202805200
6a02*48E189A2
```

At the start of the RANGEEMP4 log is the identifier for how many bytes are in the log. In this case, there are 239 bytes (just under 20% less than a Reference Log). The rest of the message is compressed binary data and is transmitted as LSB first so the bytes must be swapped before processing.

### A.2.1 Differential Header

The Differential Header is sent once per message (See *Table 161: Header* on page 723).

Decoding the bits starting with the first bytes:

*GNSS field* (16 bits)

- Grab the first 2 bytes (16 bits) = 0x0300
- Swap the bytes = 0x0003
- 0x0003 in binary form =

0000 0000 0000 0011

In this example the receiver was configured to track only GPS and GLONASS systems. If other systems had been in the configuration and tracked, they would have shown here.

### A.2.2 Differential Satellite and Signal Block

This block is sent once for each bit set to 1 in the GNSS field found in *Table 161: Header* on page 723. As identified by the above GNSS field, the first system (right to left) is the GPS System. Use *Table 162: Satellite and Signal Block* on page 723 to determine what satellites and signals data are contained in this GPS System:

#### GPS Satellites field (64 bits)

- Grab the next 8 bytes (64 bits) = 0x0042120400000000
- Swap the bytes = 0x...000000004124200
- 0x000000004124200 in binary form =

- The 1's above identify that there are 5 tracking GPS PRNs.

#### GPS Signals field (16 bits)

- Grab the next 2 bytes (16 bits) = 0x9200
- Swap the bytes = 0x0092
- 0x0092 in binary form =

- The 1's above identify that there are 3 tracking GPS signals: L1CA, L2Y, and L5Q.

#### GPS Included Signals field (5 PRNs x 3 Signals = 15 bits – therefore need 2 bytes)

Up to the point of processing the Included Signals field, the bytes are aligned such that the bits start and end within each batch of bytes. After processing this step, it is quite common for the Included Signals field (mxn matrix) to not be divisible by 8 so bytes not processed will need to be carried over to the next section depending on the size of the matrix.

- Grab the next 2 bytes (16 bits) = 0xdf6
- Swap the bytes = 0xf6df
- 0xf6df in binary form = 1111011011011111
- Only need 15 of the 16 bits = X1111011011011111
- This bit string breaks down into 5 rows (PRNs) and 3 columns (signals) as specified by the mxn (PRN x signals) parameters. Take the bit string and break it up into sets of 3 starting at the MSB. This will result with the lowest PRN being at the bottom row of the stack and the first signal (L1CA) being the far right column.

```

111
011
011
011
111

```

- This stack can be further broken apart to identify the PRNs vs. their Signals:

PRN	L5Q	L2Y	L1CA
27	1	1	1
21	0	1	1
18	0	1	1
15	0	1	1
10	1	1	1

### A.2.3 Differential Measurement Block Header

This block is sent once for each bit set to 1 in the Satellites field found in *Table 162: Satellite and Signal Block* on page 723. Now that the PRN's signals have been determined, the next step is to determine the specifics of the first PRN (10) and its list of signals (L1CA, L2Y, L5Q). Working from bottom right to upper left of the PRN/Signal chart above, each 1 represents a signal for a PRN. Use *Table 163: Measurement Block Header* on page 724 to determine the contents of each field:

*GPS PRN 10* (first PRN found in the Satellites field)

We will grab enough bytes to process the whole Measurement Block Header. If this was a GLONASS system, a total of 9 bits would be required at this step (1 bit for the Data Format Flag, 3 bits for the Ref Data Block ID, plus 5 bits for the GLONASS Frequency Number). Since this is a GPS system, only 4 bits in total are required (1 bit for the Data Format Flag and 3 bits for the Ref Data Block ID).

There was 1 bit not processed in the last byte so that byte will be carried forward. Only 4 bits need to be looked at for this step so grab the next byte as well:

- Use the last byte (0xf6) plus the next byte (0x88)= 0xf688
- Swap the bytes = 0x88f6
- 0x88f6 in binary form = 1000 1000 1111 0110
- Ignore the processed bits from the last step = 1000 1000 1XXX XXXX
- Ignore the 5 MSB bits leaving 4 bits for processing =

```

xxxx x000 1xxx xxxx
          1          = Data Format Flag (1 bit)
          000        = Ref Data Block (3 bits)

```

The Data Format Flag identifies that this batch of data is Differential (1) data.

The Ref Data Block ID is 0x000. The Ref Data Block ID here identifies that this differential data will be calculated from the Reference data that had a Ref Data Block ID equaling 000 (which was determined in the RANGEEMP4 log at time 507977.00 seconds).

The 5 MSBs have not been processed so this byte will be carried forward.

Logs between seconds will be Differential logs but could be Reference logs depending on the compression calculations. If a discontinuity occurred that made it impossible for a Differential calculation to fit within the Differential Constraints, it will revert to a Reference log.

### A.2.4 Differential Measurement Block

This block is sent once for each bit set to 1 in the Included Signals field found in *Table 162: Satellite and Signal Block* on page 723. Use *Table 166: Primary Differential Signal Measurement Block* on page 727 and *Table 167: Secondary Differential Signals Measurement Block* on page 728 to determine the contents of each field:

A Measurement Block for a single PRN will look like the following:

Primary Parity Flag

Primary  $\frac{1}{2}$  Cycle Slip Flag

Primary C/No

Primary Lock Time

Primary Pseudorange Std Deviation

Primary Phaserange Std Deviation

Primary Pseudorange

Primary Phaserange - Primary Pseudorange (determines the Phaserange for the 1<sup>st</sup> Signal)

Primary Doppler

2<sup>nd</sup> Parity Flag

2<sup>nd</sup>  $\frac{1}{2}$  Cycle Slip Flag

2<sup>nd</sup> C/No

2<sup>nd</sup> Lock Time

2<sup>nd</sup> Pseudorange Std Deviation

2<sup>nd</sup> Phaserange Std Deviation

2<sup>nd</sup> Pseudorange - Primary Pseudorange (determines the Pseudorange for the 2<sup>nd</sup> Signal)

2<sup>nd</sup> Phaserange – 2<sup>nd</sup> Pseudorange (determines the Phaserange for the 2<sup>nd</sup> Signal)

2<sup>nd</sup> Doppler – Primary Doppler (determines the Doppler for the 2<sup>nd</sup> Signal)

3<sup>rd</sup> Parity Flag

3<sup>rd</sup>  $\frac{1}{2}$  Cycle Slip Flag

3<sup>rd</sup> C/No

3<sup>rd</sup> Lock Time

3<sup>rd</sup> Pseudorange Std Deviation

3<sup>rd</sup> Phaserange Std Deviation

3<sup>rd</sup> Pseudorange - Primary Pseudorange (determines the Pseudorange for the 3<sup>rd</sup> Signal)

3<sup>rd</sup> Phaserange – 3<sup>rd</sup> Pseudorange (determines the Phaserange for the 3<sup>rd</sup> Signal)

3<sup>rd</sup> Doppler – Primary Doppler (determines the Doppler for the 3<sup>rd</sup> Signal)

...

### A.2.5 Differential Primary Signal Measurement Block GPS PRN 10 – L1CA

The next bytes collected will be for the GPS PRN 10 - L1CA signal data. Since this is the primary signal of the PRN, its Measurement Block consists of 78 bits as listed in *Table 166: Primary Differential Signal Measurement Block* on page 727.

The signal info section (top 25 bits) is processed as follows:

- With 5 bits left from the previous byte, we calculate  $25 - 5 = 20$  bits which rounds up to 3 bytes. Therefore the previous last byte (0x88) plus the next 3 bytes will be needed.

- Use the last byte (0x88) plus grab 3 bytes (x831f61) = 0x88831f61

- Swap the bytes = 0x611f8388

- 0x611f8388 in binary form

= 0110 0001 0001 1111 1000 0011 1000 1000

- Only need 25 bits. The last byte uses the 5 MSBs and the first byte ignores the 4 MSBs

XXXX 0001 0001 1111 1000 0011 1000 1XXX

1 = Parity Flag

0 = ½ Cycle Slip Flag

1000 0011 100 = C/No

1111 = Lock Time

0001 = Pseudorange Std Deviation

0001 = Phasorange Std Deviation

- Parity flag is a 1 (Parity Known)
- ½ Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
 $0x10000011100b = 1052 \times \text{Scaling factor of } 0.05$   
 $= 52.60 \text{ dBHz}$
- The Lock Time value is:  
 $0x1111b = 15$  which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
 $0x0001b = 1$  which means:  $0.020 \text{ m} < \text{PSR Std Dev} \leq 0.030 \text{ m}$  using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
 $0x0001b = 1$  which means:  $0.0039 < \text{ADR Std Dev} \leq 0.0052 \text{ cycles}$  using *Table 170: ADR Std Dev* on page 731Table 10.
- For the following calculations, the time difference between the Differential Log and the Reference log is 0.25 seconds as shown below:  
 $\text{Time Difference} = \text{Current Log Time} - \text{Reference log Time}$   
 $= 507977.250 - 507977.000$   
 $= 0.250 \text{ seconds}$

The signal data section (bottom 53 bits) is processed as follows:

- With 4 bits unprocessed from the previous byte, we calculate  $53 - 4 = 49$  bits = 7 bytes (7 bits will not be processed in the last byte).

- Use the last byte (0x61) plus grab 7 bytes (0x02005500e70162)  
= 0x6102005500e70162
- Swap the bytes = 0x6201e70055000261
- 0x6201e70055000261 in binary form =  
0110 0010 0000 0001 1110 0111 0000 0000 0101 0101 0000 0000 0000 0010 0110 0001
- Only need 53 bits. Ignore last 4 LSBs and first 7 MSBs =

```

xxxx xxx0 0000 0001 1110 0111 0000 0000 0101 0101 0000 0000 0000 0010 0110 xxxx
                                000 0000 0000 0010 0110      = 1st Pseudo - Predicted Pseudo
                                000 0000 0101 0101 0        = 1st Phase - Predicted Phase
0 0000 0001 1110 0111 0                                     = 1st Doppler - Ref Doppler
    
```

- Use *Table 166: Primary Differential Signal Measurement Block* on page 727 to identify if a 2's Complement Conversion is needed as well as what Scale Factor should be used before these binary numbers are used in the following calculations.

- The 1st (Primary) Differential Pseudorange is processed by:

$$\begin{aligned} \text{Predicted Pseudorange} &= \text{Reference 1st Pseudorange} + (1\text{st Doppler} \times \text{TimeDifference}) \\ &= 21540181.930275 \text{ m} \\ &= 21540290.811 \text{ m} + ((-435.5229 \text{ m/s}) \times 0.250 \text{ s}) \end{aligned}$$

$$\begin{aligned} \text{1st DiffPseudorange} - \text{Predicted Pseudorange} &= 0x0000000000000100110b \times \text{Scaling Factor} \\ \text{1st DiffPseudorange} - 21540181.930275 \text{ m} &= 38 \times 0.0005 \\ \text{L1CA Pseudorange for PRN 10} &= 21540181.949275 \text{ m} \end{aligned}$$

- The 1st (Primary) Differential Phaserange is a 2's Complement number (as identified by the Range column in *Table 166: Primary Differential Signal Measurement Block* on page 727) so it is processed in the following manner:

$$\begin{aligned} \text{Predicted Phaserange} &= \text{Reference 1st DiffPhaserange} + (1\text{st Doppler} \times \text{TimeDifference}) \\ &= 21540291.5622 \text{ m} + ((-435.5229 \text{ m/s}) \times 0.250 \text{ s}) \\ &= 21540182.681475 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{1st DiffPhaserange} - \text{Predicted Phaserange} &= 2\text{'s Complement}(0x0000000010101010b) \times \text{Scaling Factor} \\ \text{1st DiffPhaserange} - 21540182.681475 \text{ m} &= 170 \times 0.0001 \\ \text{L1CA Phaserange} &= 21540182.698475 \text{ m} \end{aligned}$$

- Convert this to ADR to check against the original RANGE log:

$$\begin{aligned} \text{ADR} &= \text{1st DifPhaserange} \times \text{Frequency} \times (-1)/\text{Speed Of Light} \\ \text{ADR} &= 21540182.698475 \text{ m} \times 1575420000 \text{ Hz} \times (-1)/299792458 \text{ m/s} \\ \text{L1CA ADR for PRN 10} &= -113194424.0799796 \text{ cycles} \end{aligned}$$

 In the range logs, PSR and ADR have opposite signs.

- The 1st (Primary) Differential Doppler is a 2's Complement number (as identified by the Range column in *Table 166: Primary Differential Signal Measurement Block* on page 727) so it is processed in the following manner:

$$\begin{aligned} \text{1st DiffDoppler(m/s)} - \text{Reference 1st Doppler} &= 2\text{'s Complement}(0x000000001111001110b) \times \text{Scaling Factor} \\ \text{1st DiffDoppler(m/s)} - (-435.5229 \text{ m/s}) &= 974 \times 0.0001 \\ \text{L1CA Doppler(m/s)} &= -435.4255 \text{ m/s} \end{aligned}$$

Convert the Doppler to Hz:

1st DiffDoppler(Hz) = 1st DiffDoppler(m/s) x Frequency \* (-1)/Speed Of Light  
 1st DiffDoppler(Hz) = -435.4255 m/s x 1575420000 Hz \* (-1)/299792458 m/s  
 L1CA Doppler(Hz) for PRN 10 = 2288.1764464 Hz

### A.2.6 Differential Secondary Signals Measurement Block GPS PRN 10 – L2Y

Unlike Reference logs which always reflect back to the initial signal for their computations, Differential logs uses the last Reference log data of the same signal for its calculations.

- With 7 bits unprocessed from the previous byte, we will require  $74 - 7 = 67$  bits which rounds up to 9 bytes.
  - Use the last byte (0x62) plus grab the next 9 bytes (0xdc977c004015c07988)  
 = 0x62dc977c004015c07988
  - Swap the bytes = 0x8879c01540007c97dc62
  - 0x8879c01540007c97dc62 in binary form =  
 1000 1000 0111 1001 1100 0000 0001 0101 0100 0000 0000 0000 0111 1100 1001 0111 1101 1100 0110 0010
  - Only need 74 bits. The 1 LSB is ignored as it was already processed above and the 5 MSBs are ignored so there is a total of 74 bits to process

```

xxxx x000 0111 1001 1100 0000 0001 0101 0100 0000 0000 0000 0111 1100 1001 0111 1101 1100 0110 001x
                                                                                               1 = Parity Flag
                                                                                               0 = 1/2 Cycle Slip Flag
                                                                                               01 1100 0110 0 = C/No
                                                                                               11 11 = Lock Time
                                                                                               01 01 = Pseudorange Std Deviation
                                                                                               00 10 = Phasorange Std Deviation
                                                                                               0 0000 0000 0000 0111 11 = Pseudo - Predicted Pseudo
                                                                                               000 0111 1001 110 = Phase - Predicted Phase
                                                                                               = Doppler - Ref Doppler
    
```

- Parity flag is a 1 (Parity Known)
- 1/2 Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
 0x01110001100b = 908 x Scaling Factor of 0.05  
 = 45.4 dBHz
- The Lock Time value is:  
 0x1111b = 15 which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
 0x0101b = 5 which means:  $0.099 \text{ m} < \text{PSR Std Dev} \leq 0.148 \text{ m}$  using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
 0x0010b = 2 which means:  $0.0052 < \text{ADR Std Dev} \leq 0.0070$  cycles using *Table 170: ADR Std Dev* on page 731.
- The L2Y Pseudorange is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is processed in the following manner:  
 Predicted Pseudorange = Reference 2nd Pseudorange + (2nd Doppler x TimeDifference)  
 = 21540293.6315 m + ((-435.523 m/s) x 0.250 s)  
 = 21540184.75075 m  
  
 DiffPseudorange – Predicted Pseudorange = 2's Complement(0x0000000000000011111b) x Scaling Factor  
 DiffPseudorange – 21540184.75075 m = 31 x 0.0005  
 L2Y Pseudorange = 21540184.76625 m

- The L2Y Phaserange is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is calculated in the following manner:

$$\begin{aligned} \text{Predicted Phaserange} &= \text{Reference 2nd DiffPhaserange} + (2\text{nd Doppler} \times \text{TimeDifference}) \\ &= 21540294.399 \text{ m} + ((-435.523 \text{ m/s}) \times 0.250 \text{ s}) \\ &= 21540185.51825 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{DiffPhaserange} - \text{Predicted Phaserange} &= 2\text{'s Complement}(0x0000000010101010b) \times \text{Scaling Factor} \\ \text{DiffPhaserange} - 21540185.51825 \text{ m} &= 170 \times 0.0001 \\ \text{L2Y Phaserange} &= 21540185.53525 \text{ m} \end{aligned}$$

- Convert this to ADR to check against the original RANGE log:

$$\begin{aligned} \text{ADR} &= \text{Phaserange} \times \text{Frequency} \times (-1)/\text{Speed Of Light} \\ \text{ADR} &= 21540185.53525 \text{ m} \times 1227600000 \text{ Hz} \times (-1)/299792458 \text{ m/s} \\ \text{L2Y ADR for PRN 10} &= -88203458.95116848 \text{ cycles} \end{aligned}$$

 In the range logs, PSR and ADR have opposite signs.

- The L2Y Doppler is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is calculated in the following manner:

$$\begin{aligned} \text{DiffDoppler(m/s)} - \text{Ref 2nd Doppler(m/s)} &= 2\text{'s Complement}(0x00001111001110b) \times \text{Scaling Factor} \\ \text{DiffDoppler(m/s)} - (-435.5229 \text{ m/s}) &= (974) \times 0.0001 \\ \text{L2Y Doppler(m/s)} &= -435.4255 \text{ m/s} \end{aligned}$$

Convert the Doppler to Hz:

$$\begin{aligned} \text{Doppler(Hz)} &= \text{Doppler(m/s)} \times \text{Frequency} \times (-1)/\text{Speed Of Light} \\ \text{Doppler(Hz)} &= -435.4255 \text{ m/s} \times 1227600000 \text{ Hz} \times (-1)/299792458 \text{ m/s} \\ \text{L2Y Doppler(Hz) for PRN 10} &= 1782.994633 \text{ Hz} \end{aligned}$$

### A.2.7 Differential Third Signals Measurement Block GPS PRN 10 – L5Q

Unlike Reference logs which always reflect back to the initial signal for their computations, Differential logs uses the last Reference log data of the same signal for its calculations.

- With 3 bits unprocessed from the previous byte, we will require  $74 - 3 = 71$  bits which rounds up to 9 bytes.
  - Use the last byte (0x88) plus grab the next 9 bytes (0x 840f6101803a805921) = 0x88840f6101803a805921
  - Swap the bytes = 0x2159803a8001610f8488
  - 0x2159803a8001610f8488 in binary form =  
0010 0001 0101 1001 1000 0000 0011 1010 1000 0000 0000 0001 0110 0001 0000 1111 1000 0100 1000 1000
  - Only need 74 bits. The 3 LSBs are ignored as they were already processed and the 3 MSBs are ignored so there is a total of 74 bits to process.

```

xxx0 0001 0101 1001 1000 0000 0011 1010 1000 0000 0000 0001 0110 0001 0000 1111 1000 0100 1000 1xxx
                                                                                                     1 = Parity Flag
                                                                                                     0 = 1/2 Cycle Slip Flag
                                                                                                     1000 0100 100 = C/No
                                                                                                     1111 = Lock Time
                                                                                                     0000 = Pseudorange Std Deviation
                                                                                                     0001 = Phaserange Std Deviation
                                                                                                     000 0000 0000 0001 0110 = Pseudo - Predicted Pseudo
                                                                                                     000 0000 0011 1010 1 = Phase - Predicted Phase
0 0001 0101 1001 1
    
```

- Parity flag is a 1 (Parity Known)
- ½ Cycle Slip flag is a 0 (Cycle Slip Not Present)
- C/No is:  
 $0x10000100100b = 1060 \times \text{Scaling factor of } 0.05$   
 $= 53.0 \text{ dBHz}$
- The Lock Time value is:  
 $0x1111b = 15$  which means that this signal has been locked for 262144 ms or more.
- The Pseudorange Std Deviation value is:  
 $0x0000b = 0$  which means: PSR Std Dev  $\leq 0.020$  m using *Table 171: Pseudorange Std Dev* on page 732.
- The ADR Std Deviation value is:  
 $0x0001b = 1$  which means:  $0.0039 < \text{ADR Std Dev} \leq 0.0052$  cycles using *Table 170: ADR Std Dev* on page 731.
- The L5Q Pseudorange is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is processed in the following manner:  

$$\begin{aligned} \text{Predicted Pseudorange} &= \text{Reference 3rd Pseudorange} + (\text{3rd Doppler} \times \text{TimeDifference}) \\ &= 21540289.869 \text{ m} + ((-435.5149 \text{ m/s}) \times 0.250 \text{ s}) \\ &= 21540180.990275 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{DiffPseudorange} - \text{Predicted Pseudorange} &= 2\text{'s Complement}(0x000\ 0000\ 0000\ 0001\ 0110b) \times \text{Scaling} \\ &\text{Factor} \\ \text{DiffPseudorange} - 21540180.990275 \text{ m} &= 22 \times 0.0005 \\ \text{L5Q Pseudorange} &= 21540181.001275 \text{ m} \end{aligned}$$
- The L5Q Phaserange is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is calculated in the following manner:  

$$\begin{aligned} \text{Predicted Phaserange} &= \text{Reference 3rd DiffPhaserange} + (\text{3rd Doppler} \times \text{TimeDifference}) \\ &= 21540290.8584 \text{ m} + ((-435.5149 \text{ m/s}) \times 0.250 \text{ s}) \\ &= 21540181.979675 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{DiffPhaserange} - \text{Predicted Phaserange} &= 2\text{'s Complement}(0x0000000001110101b) * \text{Scaling Factor} \\ \text{DiffPhaserange} - 21540181.979675 \text{ m} &= 117 * 0.0001 \\ \text{L5Q Phaserange} &= 21540181.991375 \text{ m} \end{aligned}$$
- Convert this to ADR to check against the original RANGE log:  

$$\begin{aligned} \text{ADR} &= \text{Phaserange} * \text{Frequency} * (-1)/\text{Speed Of Light} \\ \text{ADR} &= 21540181.991375 \text{ m} * 1176450000 \text{ Hz} * (-1)/299792458 \text{ m/s} \\ \text{L5Q ADR for PRN 10} &= -84528300.92127641 \text{ cycles} \end{aligned}$$

In the range logs, PSR and ADR have opposite signs.

- The L5Q Doppler is a 2's Complement number (as identified by the Range column in *Table 167: Secondary Differential Signals Measurement Block* on page 728) so it is calculated in the following manner:  

$$\begin{aligned} \text{DiffDoppler(m/s)} - \text{Ref 3rd Doppler(m/s)} &= 2\text{'s Complement}(0x00001010110011b) \times \text{Scaling Factor} \\ \text{DiffDoppler(m/s)} - (-435.5149 \text{ m/s}) &= 691 \times 0.0001 \\ \text{L5Q Doppler(m/s)} &= -435.4458 \text{ m/s} \end{aligned}$$

Convert this to Hz:

Doppler(Hz) = Doppler(m/s) x Frequency \* (-1)/Speed Of Light

Doppler(Hz) = -435.4458 m/s x 1176450000 Hz \* (-1)/299792458 m/s

L5Q Doppler(Hz) for PRN 10 = 1708.78285 Hz

This concludes the decoding of the Differential Log for PRN 10 (signals L1CA, L2Y, and L5Q). The rest of the decoding for the other PRNs and systems are handled in the same manner.
